IMPORTANT

The wires in this mains lead are coloured in accordance with the following code:

BLUE: Neutral BROWN: Live

As the colours of the wires in the mains lead of this apparatus may not correspond with the coloured markings identifying the terminals in your plug proceed as follows,

The wire which is coloured **BLUE** must be connected to the terminal which is marked with the letter **N** or coloured black.

The wire which is coloured **BROWN** must be connected to the terminal which is marked with the letter L or coloured red.

This apparatus complies with requirements of EEC directive 76/889/EEC. Das Gerät stimmt mit den Bedingungen der EG-Richtlinien 76/889/EWG überein. Cet appareil répond aux spécifications de la directive CCE 76/889/CCE. Dit apparaat voldoet aan de vereisten van EEG-reglementen 76/889/EEG. Apparatet opfylder kravene i EF direktivet 76/889/EF. Quest'apparecchio è stato prodotto in conformità alle direttive CEE 76/889/CEE. Personal Computer

Owner's Manual

In software for the MZ-100 series computers is supported in software settle tape, etc.) in file form. The contents of all system software and the presented in this manual are subject to change without prior notice surpose of product improvement and other reasons, and case should be confirm that the file version number of the system software used matches fied in this manual.

on software for the Sharp MZ-700 series personal computer has been d by the Sharp Corporation, and all rights to such software are reserved, otion of the system software or the contents of this book is prohibited.

totoer and the contents of this manual have been fully checked for tress and correctness prior to shipment, however, if you should encroup roblems during operation or have any questions which cannot he resolviding this manual, please do not hesitate to contact your Sharr dealer more

anding the foregoing, note that the Sharp Corporation and its reprewill not assume responsibility for any losses of damages incomed as operation or use of this equipment.

Å.

This manual has been written for the MZ-700 series personal computers and the BASIC interpreter which is provided with the MZ-700.

- (1) All system software for the MZ-700 series computers is supported in software packs (cassette tape, etc.) in file form. The contents of all system software and the material presented in this manual are subject to change without prior notice for the purpose of product improvement and other reasons, and care should be taken to confirm that the file version number of the system software used matches that specified in this manual.
- (2) All system software for the Sharp MZ-700 series personal computer has been developed by the Sharp Corporation, and all rights to such software are reserved. Reproduction of the system software or the contents of this book is prohibited.
- (3) This computer and the contents of this manual have been fully checked for completeness and correctness prior to shipment; however, if you should encounter any problems during operation or have any questions which cannot be resolved by reading this manual, please do not hesitate to contact your Sharp dealer for assistance.

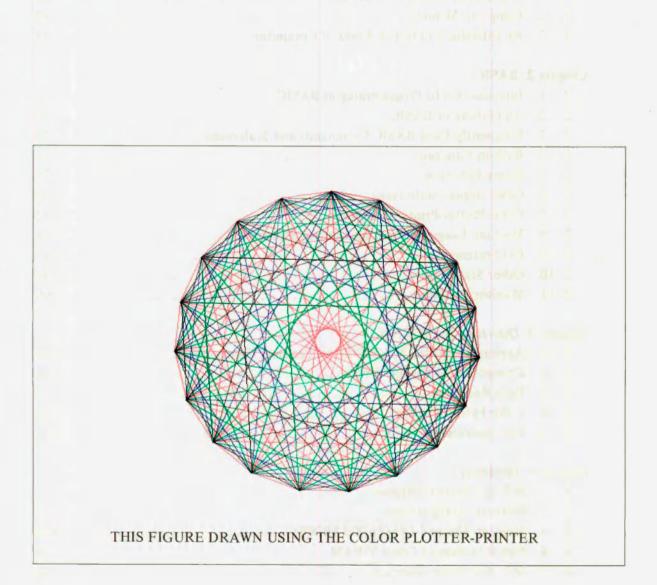

Not withstanding the foregoing, note that the Sharp Corporation and its representatives will not assume responsibility for any losses or damages incurred as a result of operation or use of this equipment.

Preface

Congratulations on your purchase of a Sharp MZ-700 series personal computer. Before using your computer, please read and make sure you understand the operating procedures which are described in this manual. The features and general operating procedures are described in Chapters 1 and 3, so please read those chapters first.

All software for the MZ-700 series computers is distributed on cassette tape.

The cassette tape included with the computer contains BASIC 1Z-013B, a high level BASIC interpreter which enables programming in the BASIC language and makes it possible to utilize the full capabilities of the MZ-700. The BASIC 1Z-013B interpreter and procedures for its use are fully described in this manual.

THE WORLD OF MZ-700 SERIES PERSONAL COMPUTER

Chapter 1

COMPUTER

l expressions to convey meanings.

Sharp MZ-700 series, however, convey meaning through an ordinary television set by TV set can be used, either color or black-and-white; or, you may invest in one screems available if you want greater resolution and sharpness; you will be surprised

1.1 Features of the MZ-700 Series

In the space of just a few decades, the computer has undergone a dramatic transformation, changing from an intricate, enormously expensive monster weighing several dozen tons into a compact, inexpensive device which can be used by almost anyone. Whereas access to computers used to be limited to a few privileged individuals with special training, the inexpensive, user-friendly machines now available make the world of computing open to people in all different walks of life. The Sharp MZ-700 series computers are representative of such machines.

People use words and expressions to convey meanings.

Computers of the Sharp MZ-700 series, however, convey meaning through an ordinary television set or special printer. Any TV set can be used, either color or black-and-white; or, you may invest in one of the special display screens available if you want greater resolution and sharpness; you will be surprised at the beauty which is provided by such displays.

A tape recorder can be connected to computers of the Sharp MZ-700 series to record programs, the instructions which control the operation of the computer. When *printed* records of such programs or of the results of computer processing are desired, they can be obtained on the MZ-700's compact, elegantly designed 4-color plotter-printer.

Note: In the remainder of this manual, the term "MZ-700" will be used to indicate any of the computers of the MZ-700 series (the MZ-711, MZ-721, and MZ-731).

1.2 Using this Manual

Before starting to study programming, why not try playing with the MZ-700 a bit? We're sure you want to do that anyway, rather than waiting until after you have read this book. First, cead "Operating the MZ-700" in Chapter 3 (you need read only those parts which apply to the model which you are using). Connect the MZ-700 to a television, read the explanation of procedures for using the keyboard, and learn which characters are output when each key is presed and the starter.

If you are using the MZ-700 t find it difficult t language; how they are encour You may ski Control Statemen programming in BA

that order. At first, you may a of the BASIC programming to key in the examples as what BASIC is all about thine Language Program completely mastered

If you have used the MZ-700 are used in the MZ-700 can be used in the MZ-700 can be used in almost exactly the sum of the MZ-700 can be used in almost exactly the sum of the MZ-700 can be used statements (applicable to b the more statement and the color plotter-printer) which have been added, bowever, you should find it easy to become fartS7=ZMthese by reading sections 2, 6 "Color display statement" and 2, 7 "Color Plotter-printer Commands." Having done this, you will quickly be captivated by the power of expanded BASIC.

This manual also includes a discussion of "Operating the MZ-700" (Chapter 3), a reference section entitled "Hardware" (Chapter 4), a discussion of the "Model of the "Model of the "Model of the and Subroutines" (Chapter 5), and appendices of other information

Now go ancao telpful.

ou will find this manual

MZ-711

1.2 Using this Manual

Before starting to study programming, why not try playing with the MZ-700 a bit? We're sure you want to do that anyway, rather than waiting until after you have read this book. First, read "Operating the MZ-700" in Chapter 3 (you need read only those parts which apply to the model which you are using). Connect the MZ-700 to a television, read the explanation of procedures for using the keyboard, and learn which characters are output when each key is pressed.

If you are using the MZ-700 for the first time, read Chapters 1 and 2, in that order. At first, you may find it difficult to grasp the meanings of the various commands and statements of the BASIC programming language; however, even if you don't understand the explanations, be sure to key in the examples as they are encountered. As you do so, you will gradually develop a concept of what BASIC is all about.

You may skip over those portions of Chapter 2 which start with 2. 8 "Machine Language Program Control Statements"; however, these sections will prove useful when you have completely mastered programming in BASIC, or wish to become more familiar with the computer's internal operation.

If you have used the MZ-80K, you will find that the commands and statements of BASIC for the MZ-700 are used in the same manner as those of the SP-5025 family, so that the MZ-700 can be used in almost exactly the same manner as the MZ-80K. The major difference between the two is in the color statements (applicable to both the television screen and the color plotter-printer) which have been added; however, you should find it easy to become familiar with these by reading sections 2. 6 "Color display statement" and 2. 7 "Color Plotter-printer Commands." Having done this, you will quickly be captivated by the power of expanded BASIC.

This manual also includes a discussion of "Operating the MZ-700" (Chapter 3), a reference section entitled "Hardware" (Chapter 4), a discussion of the "Monitor Commands and Subroutines" (Chapter 5), and appendices of other information.

Now go ahead and learn everything you can about the MZ-700. We hope that you will find this manual helpful.

1.3 An Introduction to the World of Computers

1.3.1 What is BASIC?

People use language to communicate with each other, and specially designed languages are also used for communication with computers. BASIC is one such language.

Beginner's All-purpose Symbolic Instruction Code

Just as human beings use languages such as English, French, German, and Japanese for communication, there are also many different languages which are used for communication with computers. Among these are BASIC, FORTRAN, COBOL, and PASCAL. Of these, BASIC is the computer language whose structure is closest to that of the languages used by humans, and therefore is the easiest for humans to understand.

1.3.2 Loading BASIC into the MZ-700

The BASIC language must be loaded into the MZ-700 before it can be used to do any work. A cassette tape containing this language has been included in the case containing the MZ-700. Now let's teach the language to the computer; procedures for doing this are described below. (The explanation assumes that you are using an MZ-731; however, the procedures are basically the same for all computers of the MZ-700 series.)

- (1) Connect the display as described on page 106.
- (2) Turn on the power switch located on the back of the computer.
- (3) The following characters are displayed on the screen and a square, blinking pattern appears. This pattern is referred to as the cursor.
 - ** MONITOR 1Z-Ø13A **

***** *

- (4) Set the cassette tape containing the BASIC language in the computer's data recorder.
- (5) Type in the word [L]O[A]D and press the |CR| key. After doing this, the message \pm PLAY appears

(4) Now let's take a peek at the program. Hold down the SHIFT key and rorun

- after another. (Output of the list can be temporarily stopped at any time neers the list can be space
 - (6) Press the data recorder's <u>PLAY</u> button; the cassette tape starts moving and loading of the BASIC language begins.
- (7) After loading has been completed, the message READY is displayed and the cursor starts to
- recorder. LOAD the program, then RUN it. The previous program is automation and them

memory when the new one is loaded, so the computer contains only the BASIC language and

Notes:

- *1 LOAD ... This is the instruction for loading programs or data from cassette tape.
- *2 $|\overline{CR}|$ This is referred to as the carriage return key, and is mainly used to indicate completion of entry of an instruction.

This completes loading of the BASIC program. You can talk to the computer using BASIC, and the computer will respond.

1.3.3 Try Executing a Program

Loading BASIC into the computer doesn't cause it to do anything; first, it must be given instructions in BASIC as to what it is to do. Although we will not explain the instructions of BASIC until later, let's go ahead and try executing a BASIC program right now.

Remove the cassette tape from the recorder and turn it over so that the "B" side is up. A sample program is recorded on this side of the cassette tape. Using the following procedures, load this program into the computer and execute it.

- (1) After turning the tape over and reloading it into the recorder, press the REWIND button to rewind it. Next, type in $\boxed{L[0][A][D]}$ and press the \boxed{CR} key; when the message \pm PLAY is displayed, press the \boxed{PLAY} button on the data recorder. This begins loading of the sample program.
- (2) When loading is completed, the cassette tape stops, READY is displayed on the screen, and the cursor starts to blink again.
- (3) Now that the program has been loaded into the computer's memory, try executing it. This is done by typing in $\mathbb{R}[\overline{U}][\mathbb{N}]$ and pressing the $|\overline{CR}|$ key.
- (4) Now let's take a peek at the program. Hold down the <u>SHIFT</u> key and press the <u>BREAK</u> key. This stops program execution and displays the words BREAK and READY, then the cursor starts to blink again.
- (5) Type in $[\underline{L}][\underline{I}][\underline{S}][\underline{T}]$ and press the $|\underline{CR}|$ key. This lists the lines of the program on the screen one after another. (Output of the list can be temporarily stopped at any time by pressing the space bar.)
 - (6) If you wish to resume program execution, type in $\overline{\mathbb{R}}[\overline{U}][\overline{N}]$ again and hit the $|\overline{\mathbb{CR}}|$ key.
- (7) If you want to run a different program, set the cassette tape containing that program in the recorder, LOAD the program, then RUN it. The previous program is automatically erased from memory when the new one is loaded, so the computer contains only the BASIC language and the last program loaded.

14 —

Chapter 2

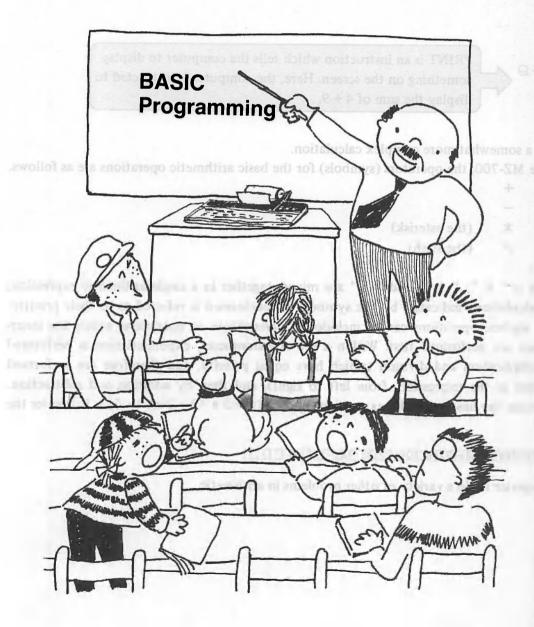

duction to Programming in BASIC

shold

The made some key entries on the MZ-700, you have reache **DIRAB** out arming how to program. Before you start, however, try usi **DIRAB** out procket calculator. (This is called operating the MZ-700 in the "direct mode".) Key as you would on a pocket calculator.

computer doesn't do anything when it is presented with a problem in this form; in ordinary calculator are completely different in this respect, and instructions must which can be understood by the computer (i.e. in the form prescribed by the BASIC voing in the following.

conectly, the number "13", will be displayed and the screen will appear as shown

2.1 Introduction to Programming in BASIC

2.1.1 Direct Mode

Now that you have made some key entries on the MZ-700, you have reached the point where you are ready to start learning how to program. Before you start, however, try using the MZ-700 as you would an ordinary pocket calculator. (This is called operating the MZ-700 in the "direct mode".) Key in the following, just as you would on a pocket calculator.

4+9=CR

As you can see, the computer doesn't do anything when it is presented with a problem in this form; your computer and an ordinary calculator are completely different in this respect, and instructions must be entered in a form which can be understood by the computer (i.e, in the form prescribed by the BASIC language). Now try typing in the following.

PRINT 4+9CR

If you have done this correctly, the number "13" will be displayed and the screen will appear as shown below.

Now let's try doing a somewhat more complex calculation.

With BASIC for the MZ-700, the operators (symbols) for the basic arithmetic operations are as follows.

Addition:+Subtraction:-Multiplication:*Division:/

Exponentiation: 1

When symbols such a "*", "+", and " \uparrow " are mixed together in a single arithmetic expression, the order in which calculations indicated by the symbols are performed is referred to as their priority. Just as with ordinary algebra, operations can be included in parentheses, so operations within the innermost set of parentheses are performed first. Within a set of parentheses, exponentiation is performed first, followed by multiplication and division (which have equal priority, and therefore are performed as they are encountered in the expression, from left to right), and then by addition and subtraction.

For example, to obtain the answer to the expression $3 \times 6 \times (6 + 3 \times 9 - 2 \times (4 - 2) + 1)$, enter the following.

PRINT 3*6*(6+3*(9-2*(4-2)+1))

(the asterisk)

(the slash)

Now try using the computer to do a variety of other problems in arithmetic.

[ANSWER]

1. 6+4 6-4	PRINT	(6+4)/(6-4)
2. 3× 15+9× (9-2) -	6 4-2+5 PRINT	3*(5+9*(9-2)-6/(4-2)) +5
3. (3+4) × (5+6)		(3+4)*(5+6)
4. $\frac{10+20}{6} \times (2+3)$		(1Ø+2Ø) /6¥(2+3)
5. <u>10+20</u> 6×(2+3)	25 PRINT	(1Ø+2Ø) /(6*(2+3))

After going through the exercises, try typing in 25×8 and pressing the CR key; the answer "40" is displayed. The reason for this is that BASIC interprets the question mark in the same manner as the instruction PRINT. Remember this as a convenient, abbreviated form of the PRINT instruction.

Now try entering the following. (The quotation marks are entered by holding down \boxed{SHIFT} and pressing the $\boxed{2}$ key.)

PRINTU4+9=UCR

As you can see, the characters within quotation marks are displayed on the screen, but the answer is not. Now try entering the following.

```
PRINT ABCDEFG CR
```

This causes ABCDEFG to be displayed on the screen.

In other words, using the PRINT instruction together with quotation marks tells the MZ-700 to display characters on the screen exactly as they are specified between quotation marks. The characters within any set of quotation marks are referred to as a "character string" or "string".

```
Now go on to enter the following.
```

This causes the following to be displayed on the screen. 4+9=13.... (The "_" symbol indicates a space. Actually, nothing is display-

ed on the TV screen in the position indicated by this symbol.) In other words, the instruction above tells the computer to display both the character string "4 + 9 =" and the result of the arithmetic expression "4 + 9 =". Now try entering the following.

PRINT 4+9= 4+9CR

After typing in this entry, the following should be displayed on the screen.

4+9=____13

The reason the screen appears different this time is because the PRINT instruction displays items of information (character strings or the results of arithmetic expressions) differently depending on whether they are separated from each other by semicolons or commas.

Semicolon (;) Instructs the computer to display items immediately adjacent to each other.
Comma (,) Instructs the computer to display the item at the position which is 10 spaces (columns) from the beginning of the display line.

17

If you have the MZ-731 (or a separate plotter-printer), now try appending the characters $\lceil / P \rfloor$ to the end of the word PRINT.

PRINT/P=4+9=*:4+9CR

This time nothing appears on the display screen, but the same result is printed out on the plotter-printer. In other words, the $\lceil / P_{\perp} \rceil$ symbols switch output from the display to the plotter-printer.

This completes our explanation of procedures for using the MZ-700 as you would a pocket calculator.

Note: PRINT "5 + 8 ="; 5 + 8 displays 5 + 8 = 13, while PRINT "5 - 8 ="; 5 - 8 displays 5 - 8 = -3. The reason for this is that one space is always reserved for a symbol indicating whether the result is positive or negative, but the symbol is only displayed in that space when the result is negative.

2.1.2 Programming

Let's try making a simple program. However, first let's make sure that the area in the computer's memory which is used for storing programs is completely empty. Do this by typing in NEW and pressing the $|\overline{CR}|$ key. (This instruction will be explained in more detail later; see page 32.)

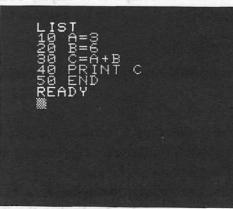

Type in the following program exactly as shown.

		Assigns the value 3 to A.
2Ø	B=6[CR]	Assigns the value 6 to B.
ЗØ	C=A+BCB	Assigns the result of $A + B$ to C.
4Ø	? CICRI	Displays the value assigned to C.
5Ø	ENDICRI	Instruction indicating the end of the program.

The numbers 10, 20, 30, and so forth at the left end of each line are referred to as program line numbers, or simply line numbers; these numbers indicate the order in which instructions are to be executed by the computer. Instructions on the lowest numbered line are executed first, followed by those on the next lowest numbered line, and so forth. Line numbers must be integers in the range from 1 to 65535.

The line numbers 1, 2, 3, and so forth could have been used in this program instead of 10, 20, 30. However, it is common practice to assign line numbers in increments of 10 to provide room for later insertion of other lines.

Now let's check whether the lines have been correctly entered. Type in LIST and press the $|\overline{CR}|$ key; this causes a list of the program lines to be displayed. Notice that the question mark entered at the beginning of line 40 has been converted to PRINT, the full form of the command for displaying data on the display screen.

After typing in this entry, the fi

l instruction displays items of ferently depending on whether

nediately adjacent to each other. display the item at the position which is 10

spaces (columns) from the beginning of the display line.

18.

5 2

Now let's try executing the program.

ten type in the following from the keyboard SAVE ' CALCULATION' J

RUNCR

Enter RUN and press the $|\overline{CR}|$ key; the result is displayed on line 9 of the screen.

Now we will explain procedures for making changes in programs. First, let's change the instruction on line 20 from B = 6 to B = 8. Type in LIST 20 and press the $[\overline{CR}]$ key; this displays just line 20 of the program on the screen. Next, use the cursor control keys (the keys at the right side of the keyboard which are marked with arrows) to move the cursor to the number $\lceil 6 \rfloor$, then press the $[\overline{SR}]$ key and the $|\overline{CR}|$ key in succession to make the change. Note that the change is not completed until the $|\overline{CR}|$ key is pressed.

Now type in LIST and press the $|\overline{CR}|$ key again to confirm that the change has been made.

Next, let's change line 30 of the program to $C = 30 \times A + B$.

Using the cursor control keys, move the cursor so that it is positioned on top of the "A" in line 30, then press the <u>INST</u> key three times in succession. This moves "A + B" three spaces to the right. $C = _ _ _ _ A + B$ $\stackrel{1}{\frown} Cursor position$

Now type in [3][0][x] and press the |CR| key to complete the insertion. LIST the program to confirm that the change has been made correctly.

Now change line 30 again so that it reads "C = 30 \times A" instead of "C = 30 \times A + B". Do this by moving the cursor to the position immediately to the right of B and pressing the <u>DEL</u> key two times; this deletes "+B". Press the <u>CR</u> key to complete the change.

Now LIST the program and confirm that it appears as shown below.

1Ø	A=3	
A CONTRACTOR OF	B=8	
ЗØ	$(= \exists (\land X \land \land$	that with the specified name. If the file name is not specified (if only LOAD).
4Ø	PRINT C	loads the first program encountered.
5Ø	END	

To delete an entire line from a program, simply enter the line number of that line and press the $|\underline{CR}|$ key; delete line 20 in this manner, then LIST the program to confirm that the line has been deleted.

We could insert the instruction "?A" between lines 30 and 40, by typing in 35_?A and pressing the $\overline{|CR|}$ key. Try this, then LIST the program to confirm that the line has been added. Now delete line 35 by entering 35 and pressing the $\overline{|CR|}$ key.

The process of changing or inserting lines in a program in this manner is referred to as editing, and the program which results from this process is referred to as the BASIC text. Each line of the program can include a maximum of 255 characters, including the line number, but the maximum length is reduced by four characters if the question mark is used to represent the PRINT instruction.

At this point, the program contained in the computer's memory should be as follows.

1Ø A=3 3Ø C=3Ø*A 4Ø PRINT C 5Ø END

Now we will use this program to explain the procedures for recording programs on cassette tape. Prepare a blank cassette tape (one on which nothing has been recorded) and set it in the data recorder, then type in the following from the keyboard.

SAVE "CALCULATION" J

Here, "CALCULATION" is the name which is to be recorded on the cassette tape to identify the program. Any name may be assigned, but the name connot be longer than 16 characters.

Note: The J symbol in the example above represents the $|\overline{CR}|$ key.

When the CR key is pressed, " \pm RECORD. PLAY" is displayed on the screen. Pressing the <u>RECORD</u> button on the data recorder at this time records the program on cassette tape.

The name which is assigned to the program is referred to as its file name. Specification of a file name is not absolutely necessary, but from the point of view of file management it is a good idea to assign one. Of course, the file name is recorded on the tape together with the program.

When recording is completed, READY is displayed to indicate that the computer is finished. Now press the STOP button on the data recorder and rewind the tape.

The program is still present in the computer's memory after recording is completed, so type in NEW J to delete it (enter LIST J to confirm that the program has been deleted). Now let's try using the LOAD instruction to load the program back into memory from the cassette tape as described on page 14.

When a cassette tape contains many programs, that which is to be loaded can be identified by specifying the program's file name together with the LOAD instruction as follows.

LOAD "CALCULATION" J

Specifying the file name in this manner tells the computer to ignore all programs on the tape other than that with the specified name. If the file name is not specified (if only LOAD *J* is entered), the computer loads the first program encountered.

Note: When using cassette recorder other than the data recorder built into the MZ-731, and MZ-721 read the instructions on page 109 before attempting to record or load programs.

The LIST command shown above can be used in a variety of different ways. For example, during editing LIST 20 J can be used to display just line 20 of a program. The entire program can be listed by entering LIST J. Other uses of the instruction are as follows.

	-30CR	Lists all lines of the program to line 30.
	30-CR	Lists all lines from line 30 to the end of the program.
LIST	30-50CR	Lists all lines from line 30 to line 50.
	3007	Lists line 30.

When editing programs by listing individual lines with the LIST instruction, press the CLR key (the INST key) together with the SHIFT key when the screen becomes distractingly crowded. This clears the entire screen and moves the cursor to its upper left corner. (This does not affect the program in memory). Afterwards, enter LIST < line number > J again to list the line which is to be edited.

Now we will use this program to explain the procedures for recording programs on cassette tape. Prepare a blank cassette tape (one on which nothing has been recorded) and set it in the data recorder.

2.2 An Outline of BASIC

2.2.1 Constants

A constant is a number or string of characters which is written into a program, and which is used by that program as it is executed. Types of constants include numeric constants, string (character) constants, and system constants. These are explained below.

Numeric constants

A numeric constant is a number which has a maximum of 8 significant digits. The exponent of such constants must be in the range from 10^{-38} to 10^{38} (the maximum range is 1.548437E-38 to 1.7014118E+38).

(Examples:)	217	AS		
-123.4		A tri	18 V	
Ø. 789				
3748.Ø			D. REE	
3. 7E+12 ······	3. 7×1	012	T. L	
7.65E-9	7. 65>	<10 ⁻⁹ } E indicat	tes the exponent.	
14.8E9		<10 ⁹	NSV X	

Hexadecimal numbers: Numbers can be specified in hexadecimal format only for direct memory addressing with the LIMIT, POKE, PEEK, and USR instructions (see pages 92 and 93), and are represented as four digits preceded by a dollar sign (\$).

(Examples:)

 $L \mid M \mid T$ \$BFFF USR (\$CØØØ, X\$)..... X\$ represents a string variable.

String constants

String constants are letters and symbols between quotation marks which are included in programs to allow titles or messages to be output to the display screen or printer. The characters "4+9" appearing on page 17 are a character constant, and not a numeric constant. With BASIC, a string constant may consist of a maximum of 255 characters. (Not including quotation marks which cannot be included in a string constant.)

It is not possible to use the names of BASIC commands and statements as variable r

. (Examples:)

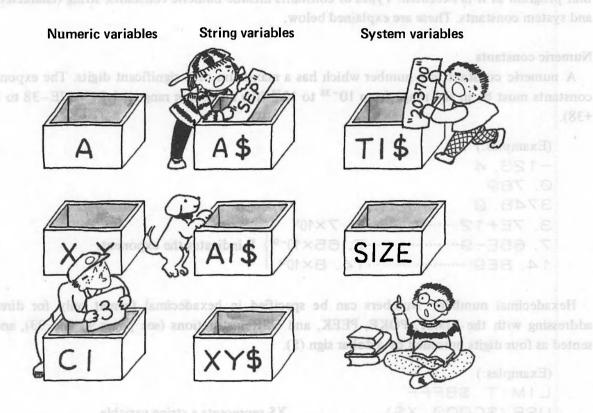

"1234567891Ø"

DATA ABCDEFG..... Quotation marks are not needed when string constants are specified in a DATA statement; however, they may be used if desired.

PRINT A Displays the value stored in variable A

2.2.2 Variables

The word "variable" has a different meaning with BASIC than it does when used with regard to algebraic expressions. To put it in very simple terms, the variables of BASIC are "boxes" in memory for the storage of numbers and characters (character strings). The types of variables used in BASIC include numeric variables, string variables, and system variables.

Numeric variables

Only numeric data can be stored in numeric variables.

Names must be assigned to these variables in accordance with the following rules.

- i) A variable name may consist of any number of characters, but only the first two characters are actually used by the BASIC interpreter to identify the variable. Further, the first character of the variable name must be a letter (A to Z), either letters or numerals may be used for subsequent characters.
- ii) It is not possible to use the names of BASIC commands and statements as variable names.

Correct variable names:

ABC, XY, ABCD, A12345 (ABC and ABCD are regarded as the same variable.)

Incorrect variable names: PRINT (PRINT is a BASIC statement)

C@ (Variable names may not include special characters.)

(Example:)

 $1 \emptyset \quad A = 5$ Stores 5 in variable A.

 $2\emptyset$ PRINT A..... Displays the value stored in variable A.

String variables

String variables are variables which are used for storing character strings. Names assigned to string variables must conform to the same rules as those assigned to numeric variables; however a dollar sign (\$) is appended to the end of string variable names to differentiate them from other types of variables.

String variables may be used to store a maximum of 255 characters. Such variables are blank until string data is assigned to them. The only operator which can be used in expressions including more than one string variable is the "+" sign.

(Example:) $1 \emptyset A \$ = "ABCD "$ Substitutes the character string ABCD into string variable A\$. $2\emptyset B \$ = "XYZ "$ Substitutes the character string XYZ' into string variable B\$. $3\emptyset C \$ = A \$ + B \$$ Substitutes the sum of string variables A\$ and B\$ (ABCDXYZ) into string variable C\$.

 $4\emptyset$ PRINT CS. Displays the contents of string variable CS.

System Variables

System variables contain values which are automatically changed by the BASIC interpreter. The system variables are size (the variable which indicates the amount of BASIC free area) and TI\$ (a 6-digit variable which contains the value of the system's 24-hour clock).

(Examples:)

1Ø TI\$= "Ø135ØØ" ··· This statement assigns the value corresponding to 1:35:00 A.M. to system variable TI\$ and sets the system clock to that time.
 2Ø PRINT TI\$······ Executing this statement displays the current time of the system clock (24-hour time).

An array must be declared before values can be stored in any of its element

Display format:

1 32819 Indicates that the time is 13:28:19.

 $\begin{array}{lll} \label{eq:result} \mathsf{PR} \mid \mathsf{NT} \quad \mathsf{S} \mid \mathsf{ZE} \textit{J} \cdots \cdots \cdots \cdots \\ \text{This displays the current amount of free space in the computer's memory (in other words, the amount of space which is available for additional program lines). The value indicated by this variable is reduced each time a program line is entered. \end{array}$

A three-dimensional array consisting of 4 x 4 x 4 elements

2.2.3 Arrays

String variables

Arrays can be thought of as shelves within the computer's memory which contain rows of boxes, each of which represents a variable. The boxes on these shelves are arranged in an orderly sequence, and are identified by means of numbers; these numbers are referred to as subscripts, because they are subscripted to the name which identifies the entire group of boxes.

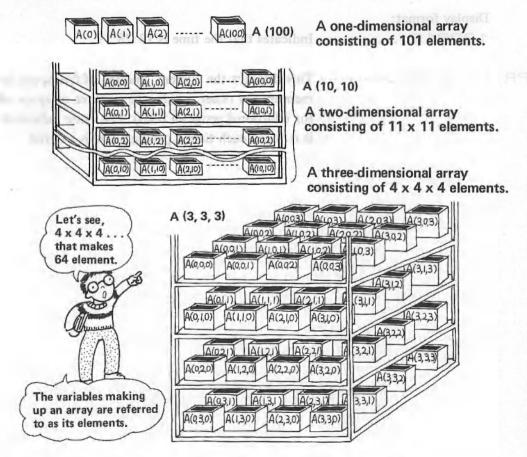

Such shelves of boxes are set up simply by executing an instruction which declares that they exist; this is referred to as making an array declaration. The array declaration specifies the number of boxes which are to be included in each set of shelves (i.e., the size of the shelves) and the manner in which they are to be arranged.

The boxes in each unit of shelves may be arranged in sequences which have any number of dimensions. Thus, a one-dimensional array can be thought of as a single shelf which holds, one row of boxes; a twodimensional array can be thought of as a stack of shelves, each of which holds one row of boxes; and so forth. These boxes, or variables, are referred to as the array's elements.

The number of subscripts used to identify each of the array elements of a corresponds to the number of dimensions in that array. For example, each of the elements in a one-dimensional array is identified by a single subscript which indicates the box's position in the row; each of the elements in a two dimensional array is identified by two subscripts, one which identifies the box's row, and one which indicates the box's position within that row; and so forth. The numbers which are used as the subscripts start with zero, and have a maximum value which is determined by the size of each of the array's dimensions (i.e., the number of boxes in each row, etc.).

The maximum size of an array is limited by the amount of free space which is available in the computer's memory (i.e., by the size of the program, the number of items of data which are to be stored in the array, and so forth). The syntax of BASIC places no restrictions on the number of dimensions which can be used for any array, but in practice the number of dimensions is limited by the amount of free memory space which is available for storage of array variables.

An array must be declared before values can be stored in any of its elements.

(Exam	ple 1)		2.4 BASIC Operations	
1Ø	DIM	A(5)	Declares 1-dimensional numeric array A with 6 eleme	ents.
2Ø		X\$(8)	Declares 1-dimensional string array X\$ with 9 eleme	nts.
1Ø	DIM	A(5), X\$(8)	Performs the same function as lines 10 and 20 ab	ove.
(Exam	ple 2)		rever, operators within parentheses always have the high	
1Ø	DIM	B(5, 5)	Declares 2-dimensional numeric array B with 6	x 6
			elements.	
2Ø	DIM	Y\$(5, 8)	Declares 2-dimensional string array Y\$ with 6 x 9 eleme	ents.
		X^{v} ; i.e., X to the Yth po	1 Exponentiation X † Y (Indicates	
1Ø	DIM	B(5, 5), Y\$(5, 8)), A(5), X\$(8) Declares two numeric ar	rays
		Y), X/Y $(\frac{X}{Y}$; i.e., X divide	and two string arrays.	
	nple 3) D M	C(3, 3, 3)	Declares 3-dimensional array C with 4 x 4 x 4 eleme	ents.

Note: Different names must be used for each array which is declared; for example, the instruction DIM A(5), A(6) is not a legal array declaration.

Try executing the program shown below and check the results which are obtained.

10 DIM A(2), B\$(2) 20 A(0)=26 30 A(1)=9 40 A(2)=-100 50 B\$(0)="ABC" 60 B\$(1)="XYZ" 70 B\$(2)="MZ-700" 80 PRINT A(1) 90 PRINT B\$(2) 100 PRINT B\$(2) 110 PRINT B\$(0)+B\$(1) 120 PRINT A(0)

Note: Individual variables within an array, such as A(5) and X\$(8), are referred to as an array's elements. Numeric constants, numeric variables, and numeric arrays are collectively referred to as numeric expressions, and string constants, string variables, and string arrays are collectively referred to as string expressions.

String operations are used to create new strings of character data by concatenating (linking) two or nore shorter strings. The only operator which can be used in string operations is the "4" sign

Displays the character string "ABCDEF

2.2.4 BASIC Operations

In BASIC, arithmetic operations take a slightly different form than is the case with ordinary arithmetic. The various arithmetic operators used in BASIC are shown in the table below. The priority of these operators when they are used together within a single expression (the sequence in which the different arithmetic operations are performed) is as indicated by the numbers in the left column of the table; however, operators within parentheses always have the highest priority.

Arithmetic operations

	Operator	Operation	Format
1	1	Exponentiation	$X \uparrow Y$ (Indicates $X^{\mathbf{v}}$; i.e., X to the Yth power.)
2	100 1021 20	Negation	X (a) A (B , a) A (C , A (C) X -
3	*,/	Multiplication, division	$X * Y$ (X times Y), X/Y ($\frac{X}{Y}$: i.e., X divided by Y)
4	+,-	Plus, minus	X + Y (X plus Y), $X - Y$ (X minus Y)

(Example 1)

10 A=3*8/4.....When a series of operators with the same priority are used in an arithmetic expression, calculations are carried out from left to right; thus, the result of the expression at left is 6.

(Example 2)

- $10 \quad A=60-6*8+2\cdots$ Result is 14.
- $2\emptyset$ B= (6 \emptyset -6) *8+2.....Result is 434.

(Example 3) $1 \oslash A = 2 \uparrow 3$ Assigns 2 to the 3rd power to A; result is 8.

String operations

String operations are used to create new strings of character data by concatenating (linking) two or more shorter strings. The only operator which can be used in string operations is the "+" sign.

(Example)

PRINT "ABC"+"DEF"J

Displays the character string "ABCDEF".

2.2.5 Initial settings	SIC Comm	y Used BA	quenti		
Initial settings made when BAS				Stat	
 Keyboard 1) Operation mode: Normal (a 		nput/output i

• Control keys and control characters

The control keys are keys which perform special functions when pressed together with the CTRL key. Functions of these keys and their corresponding ASCII codes are as shown in the table below.

CTRL +	ASCII code (decimal)	Function
Е	5	Selects the lowercase letter input mode for alphanumeric characters.
F	6	Selects the uppercase letter input mode for alphanumeric characters.
М	13	Carriage return ($ \overline{CR} $).
Р	16	Same as the DEL key.
Q R	17	Moves the cursor down one line (
R	18	Moves the cursor up one line (1).
S	19	Moves the cursor one column (character) to the right (
Т	20	Moves the cursor one column (character) to the left (.
U	21	Moves the cursor to the home position (HOME).
V	22	Clears the screen to the background color (CLR).
W	23	Places the computer in the graphic character input mode (GRAPH).
Х	24	Inserts one space ([INST]).
Y	25	Places the computer in the alphanumeric input mode.

Other

The lower limit of the BASIC text area is set to address \$FEFF; this is the same as LIMIT MAX is executed).

For initial printer settings, see the discussion of the printer.

2.3 Frequently Used BASIC Commands and Statements

2.3.1 Program file input/output instructions

Format
Function
Function

LOAD or LOAD "filename"

This command loads the specified BASIC text file or a machine language file to be linked with a BASIC program from cassette tape.

Keyboard

(See pages 14 and 20.)

Note

Only BASIC text files and machine language programs can be loaded with this command. When the file to be loaded is a BASIC text file, the current program is cleared from the BASIC text area when the new program is loaded.

When loading a machine language routine to be linked with a BASIC program, the LIMIT statement must be executed to reserve a machine language program area in memory. Further, the applicable machine language program file is executed as soon as loading is completed if the loading address is inside that area. (In this case, the BASIC text is not erased.)

The LOAD command can be used within a program to load a machine language program file.

\$0000 \$1200	Monitor
inotion i	BASIC interprete
Selects the lowercase letter input node for alphanumeric characters. Selects the upporcase letter input characters. Carsiage return (<u>CR</u>) Same as the <u>DEL</u> key. Moves the cursor down one line (E).	BASIC text area LIMIT (\$9FFF)
(\$A000) \$FEFF	Machine language area

Note: The lower limit of the BASIC text area shifts according to the size the program text loaded.

2. 3. 1. 2 SAVE (abbreviated format: SA.)

Format Function

SAVE or SAVE "filename"

This command assigns a file name to the BASIC program in the computer's memory and saves it on cassette tape.

Note

This command saves only the BASIC program text (i.e., the program text displayed by executing the LIST command); it does not save any machine language program in the machine language area.

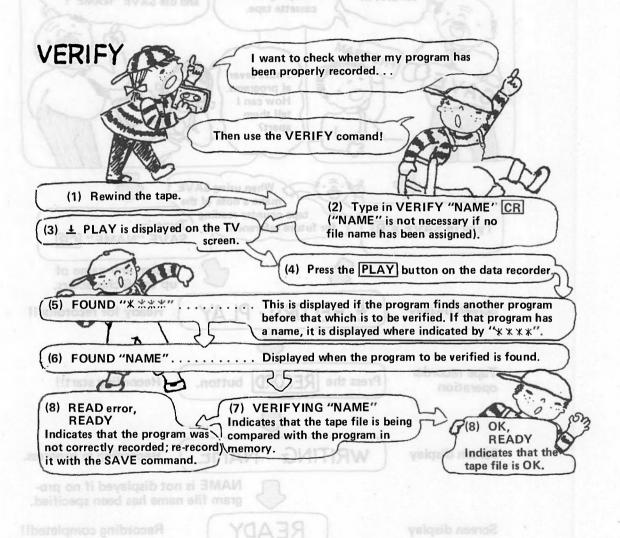

The file name specified is recorded on tape together with the BASIC text file; specify any name desired using up to 16 characters. If no file name is specified, the program is recorded without a file name; however note that this can make file management difficult if more than one program is recorded on a single tape.

2. 3. 1. 3 VERIFY (abbreviated format: V.)

Format
Function

VERIFY or VERIFY "filename"

This command is used to confirm that programs have been properly recorded on tape by the SAVE command. This is done by playing the tape and comparing the program read with the program contained in memory. If both programs are the same, "OK" is displayed; if they are different, "READ error" is displayed. In the latter case, save the program again.

This command saves only the BASIC program text (i.e., the program text displayed by executing the LIST command); it does not save any machine language program in the machine language area.

The file name specified is recorded on tape together with the BASIC text file; specify any name desired using up to 16 characters. If no file name is specified, the program is recorded without a file name; however note that this can make file management difficult if more than one program is recorded on a single tape.

	DELETE	400-1	of the program.		

-31

2. 3. 2. 3 LIST	(abbreviated format: L.)
Format	$ \begin{array}{c c} L \mid ST \\ - $
Function	This command lists all or part of the program lines contained in the BASIC text area on the display screen. $\Box ST]$ Lists the entire program. $\Box ST - 3\emptyset]$ Lists all lines of the program to line 30. $\Box ST 3\emptyset - J$ Lists all lines of the program from line 30 to the end. $\Box ST 3\emptyset - J$ Lists all lines of the program from line 30 to the end. $\Box ST 3\emptyset - 5\emptyset J$ Lists all lines of the program from line 30 to line 50. $\Box ST 3\emptyset J$ Lists line 30 of the program. Output of the program list to the display screen can be temporarily interrupted by pressing the space bar; listing is then resumed when the space bar is released. To terminate list output, press the <u>BREAK</u> key together with the <u>SHIFT</u> key.
2.3.2.4 LIST/P	(abbreviated format: L./P)
Format	LIST/P <ls-le> Ls ······ Starting line number Le ······ Ending line number</ls-le>
Function	This command lists all or part of the program in the BASIC text area on the printer. The range of program lines to be listed is specified in the same manner as with the LIST command described above. ackets < > in the above indicate that the enclosed item is optional.
	(abbreviated format: ME.)
Format Function	MERGE or MERGE "filename" The MERGE command is used to read a program from cassette tape. When a pro- gram is read using this command, it is appended to the program in memory. If "filename" is omitted, the computer reads the first file encountered on the cassette tape.
	If any line numbers in the program read are the same as those of the program in memory, corresponding lines of the program in memory are replaced with lines of the program read.
2.3.2.6 NEW	DELETE -Le. Deletes all program lines from t program to line Le.
Format Function	NEW The NEW command erases the BASIC text area and clears all variables. Execute this command when you wish to clear the program in memory prior to entering another program. This command does not erase the machine language area reserved
	by the LIMIT statement. Since the BASIC text area is automatically cleared by the LOAD command, it is
	not necessary to execute this command before loading a BASIC program from cassette tape.

.....Deletes all

2.3.2.7 RENUM	(a	bbreviated format: REN.)
Format	RENUM betaivered (a) Ln	New line number
	RENUM LnLo	
		Increment
Function	executed, line numbers referenced i	
	RENUM	program in memory so that they start
	(abbreviated format: C.)	of 10. TMOD S & & & S
		Renumbers the lines of the current program in memory so that they start
		with 100 and incremented in white of 10

RENUM 100, 50, 20..... 100, and subsequent line numbers are

with 100 and incremented in units of 10. Renumbers lines of the current program in memory starting with line number 50; line number 50 is renumbered to incremented in units of 20.

The example below shows the result of executing RENUM 100, 50, 20 for a sample

program.
(Refor

Example

Note

(Before renumbering)	(After renumbering)
5Ø A=1	$1 \varnothing \varnothing A = 1$
6Ø A=A+1	12Ø A=A+1
70 PRINT A	14Ø PRINT A
100 GOTO 60	16Ø GOTO 12Ø

When specifying the new and old line numbers, the new line number specified must be larger than the old line number. Note that an error will result if execution of this command results in generation of a line number which is greater than 65535.

Program execution stopped during Program execution stopped and

33

2.3.3 Control commands

Function

Format

RUN or RUN Ls

Ls Starting line number

This command executes the current program in the BASIC text area.

If the program is to be executed starting with the first program line, just enter RUN and press the $|\overline{CR}|$ key. If execution is to begin with a line other than that the lowest line number, type in RUN Ls (where Ls is the line number at which execution is to start) and press the $\overline{[CR]}$ key.

When this command is executed, the BASIC interpreter clears all variables and arrays before passing control to the BASIC program.

2.3.3.2 CONT. (abbreviated format: C.)

-	Format
	Function

CONT

The CONT command is used to resume execution of a program which has been interrupted by pressing SHIFT + BREAK or by a STOP statement in the program. This command can also be used to continue execution of a program which has been interrupted by an END statement; however, in this case care must be taken to ensure that lines following the END statement are not the lines of a subroutine. Examples of situations in which the CONT command can and cannot be used are shown in the table below.

	Program continuation possible	Program continuation not possible
	• Program execution stopped by pressing SHIFT + BREAK.	• Before a RUN command has been executed.
s number specified must	• Program execution stopped by a STOP command.	• "READY" displayed due to an error occurring during program execution.
wult if execution of this ter than 65535.	• Program execution stopped by pressing <u>SHIFT</u> + <u>BREAK</u> while the program was a waiting	• Cassette tape operation interrupted by pressing <u>SHIFT</u> + <u>BREAK</u> .
	input for an INPUT statement.	• Program execution stopped during execution of a MUSIC statement.
		• Program execution stopped and "READY" displayed after execution of an END statement.

Format	
Function	

BYE

This command returns control of the computer from BASIC interpreter 1Z-013B to the monitor program in RAM. (The monitor commands are explained starting on page 99.)

2. 3. 3. 4 KEY LIST (abbreviated format: K. L.)

Format

Function

KEY LIST

This command displays a list of the character strings assigned to the definable functions keys.

KEY	LIST

2.3.4 Assignment statement LET Format LET v = e or v = ev ... Numeric variable or array element, or string variable or array element. e ... Numeric expression (consisting of one or more constants, variables, or array elements) or string expression (consisting of one or more constants, variables, or array elements). Function This statement assigns the value (numeric or string) specified by e to the variable or array element specified by v. As shown in the examples below, LET may be omitted. LET 3 = A! OK, here I go! Example A=10A=10OTUA =10 LET 1Ø MUNER 20 LET B=2Ø $B=2\emptyset$ 2Ø A = A + BЗØ A = A + BBOLCO =30 LET 28H0 =40 PRINT A PRINT 40 А 5Ø END ==0 =5Ø END RUNJ ЗØ the same result.

The following are examples of incorrect use of the LET statement.
2Ø A\$=A+B······Invalid because different types of variables (string and numeric) are specified on either sides of the "=" sign.
2Ø LOG (LK) =LK+1·····Invalid because the left side of the statement is not an numeric variable or array element.

2.3.5 Input/output statements

2.3

Input/output statements are the means by which data is submitted to the computer for processing, and by which the results of processing are output to the TV screen or printer.

5.1 PRINT		
Format	(PRINT) (variable)	< (;) (variable) >
	$\left\{\begin{array}{c} \mathbf{PRINT} \\ \\ \\ \mathbf{?} \end{array}\right\} \left\{\begin{array}{c} \text{variable} \\ \text{constant} \\ \text{ex pression} \end{array}\right\}$	$\langle \{;\} \\ \langle \{,\} \rangle $ variable \rangle constant \rangle
	? expression	expression
Function	-	the values of variables, constants, character s

This statement outputs the values of variables, constants, character strings, or expressions to the display screen. Values are displayed starting at the cursor's current location on the screen. (To move the cursor down one line on the screen, execute the PRINT statement without specifying any variables, constants, or expressions.)

To simplify key input when entering this statement, a question mark (?) may be typed instead of the word PRINT.

Numeric data is displayed by this statement in one of two formats: real number format or exponential format.

Real number format

Numeric values in the range from 1×10^{-8} to 1×10^{8} are displayed in real number format.

--1.9999 63598757 Ø.ØØØØØØ1.....1 x 10⁻⁸ 99999999

Exponential

Exponential format Numbers which cannot be displayed in real number format are displayed in

exponential format.

31415E+9	IN LUSING TOTAL STATES YARAD	-0.31415×10^9
.5136Ø6E-20	J	0.513606×10^{-20}
	ic elstement highleve data on the c	

A plus (+) or minus (-) sign is always displayed ahead of the exponent (the number following "E") of a number displayed in exponential format.

Some special methods of using the PRINT statement are shown below.

The number sign is used to specify the maximum number of di-

PRINT C"	Clears the entire screen and moves the cursor to the home
	position (the upper left corner of the screen).
PRINT " 🖪 "	Moves the cursor to the home position without clearing the
	screen.
PRINT "	Moves the cursor one column to the right.
PRINT "	Moves the cursor one column to the left.
PRINT "	Moves the cursor up one line.
PRINT "	Moves the cursor down one line.

37

 $PR \mid NT$ "Control A" Clears the screen, then displays the character "A" at the beginning of the sixth line from the top.

Note: The vertical bars {...} in the format description indicate that any one of the enclosed items may be selected.

To enter the special characters for cursor control, press the **GRAPH** key; this places BASIC in the graphic character input mode and changes the form of the cursor to "III". Next, enter the characters as follows.

	Press the CL		C	BU-	Clean up an come home	d }
	Press the HO	ME key.	ut when			9
•	Press the 🖬 k	ey.	ne word PR	The		
+	Press the 🖬 k	æy.			1	1
1	Press the 🔳 k	ey memetate eint	layed by	ric data is dis	1	
1	Press the 🖪 k	æy.	format.	or exponentia	format	
						~
				BU-	Come hon	
		e from 1 x 10 ⁻⁸ to	the range	-	immediate	IV!
				2	direturn	-1
				6 10	1009	14
					14	al
				2 98757		1
			······ [*]	00000000	O: A	
				REPERSE		

After entering a special character, press the <u>ALPHA</u> key to return from the graphic character input mode to the alphanumeric input mode.

2. 3. 5. 2 PRINT USING (abbreviated format: ?USI.)

PRINT USING "format string"; variable $\langle j \rangle$ variable ... > Format Function This statement displays data on the screen in a specific format. The format specification consists of a character or string of characters in quotation marks, and is specified immediately after the word USING as follows. (1) Format specification strings for numeric values (a) # The number sign is used to specify the maximum number of digits to be displayed. If the number of digits in the number displayed is smaller than the number of # signs specified in "format string", numbers are rightjustified in the field defined by that string. (Example:) 10 A = 12320 PRINT USING "####"; A RUN J 123 and nively torned and savely

(b) .

A period may be included in a format string consisting of # signs to specify the position in which the decimal point is to be displayed. The number of # signs to the right of the decimal point specifies the number of decimal places to be displayed.

> (Example:) 10 A = 12.345 : B = 6.789 20 PRINT USING "###.##" ; A 30 PRINT USING "###.##" ; B RUN J

when goints terred with to goin 12.34 if the angle ballood to the start loog? Sold of visits bound and loog and 6.79 light of of a rais ballood a failt start.

(c),

Commas may also be included in "format string" to indicate positions in which commas are to be displayed. Numbers are right-justified in the same manner as when # signs are used alone.

(Example:)

10 A = 6345123 : B = 987324

and the second second

A plus (+) or minus (-) sign may be included at the end of "format string" to specify that the sign of the number is to be displayed in that position instead of a space. For instance, PRINT USING "####+" will cause the sign to be displayed immediately after the number. (PRINT USING "####+" causes a minus sign to be displayed following the number if the number is negative; if the number is positive, only a space is displayed in that position.) Further, a plus sign may be specified at the beginning of a format string to indicate that the number's sign is to be displayed in that position regardless of whether it is positive or negative.

(Examples)

PRINT USING "####+";-13 ___13-

PRINT USING "+####";25

all resulting values. 25+....

(Note:)

Although a minus sign will be displayed if one is specified at the beginning of the format string, it will have no relationship to the sign of the number.

5.300 6.900 7.123

(e) **

Specifying a pair of asterisks at the beginning of the format string indicates that asterisks are to be displayed in the positions of leading zeros.

(Example:) 10 A = 123420 PRINT USING " * *####"'; A colorescele RUN J 20 PRINT USING "###.##" ; A **1234

(f) ££

Specifying a pair of pound signs at the beginning of the format string indicates that a pound sign is to be displayed in the position immediately to the left of the number.

(Example:)

10 A = 123 20 PRINT USING "££####" ; A RUN J£123

(g) \$\$

Specifying a pair of dollar signs at the beginning of the format string indicates that a dollar sign is to be displayed in the position immediately to the left of the number.

(h) $\uparrow \uparrow \uparrow \uparrow$

Four exponential operators may be included at the end of a format string to control display of numbers in exponential format.

(Example:) 10 A = 51123

20 PRINT USING "##.### $\uparrow \uparrow \uparrow \uparrow$; A

causes a minus sign to be displayed foll VUN the number if the number is

Chold and the beneficial to 5.112E+04 with long at reducing out the sector sector 5.112E

In this case, the first number sign is reserved for display of the sign of the number.

(i) Extended list of operands

A list of variables may be specified following a single PRINT USING statement by separating them from each others with commas or semicolons. When this is done, the format specified in "format string" is used for display of all resulting values.

(Example:)

10 A = 5.3 : B = 6.9 : C = 7.123

20 PRINT USING "##.###"; A, B, C

RUN 🖌

<u>5.300</u>, 6.900, 7.123

(2) Format specification for string values

(a) !

When the values being displayed are character strings, specifying an exclamation mark in "format string" causes just the first character of the string specified to be displayed.

(Example:) 10 A\$ = "CDE" 20 PRINT USING "!" ; A\$ RUN J

(b) & ____ &

Specifying " $\hat{\alpha}$ $\hat{\alpha}$ " in the format string causes the first 2 + n characters of specified string expressions to be displayed (where n is the number of spaces between the two ampersands). If fewer than 2 + n characters are specified in a string expression, characters displayed are left-justified in the field defined by " $\hat{\alpha}$ $\hat{\alpha}$ ".

(Examples:)

10 A\$ = "ABCDEFGH" 20 PRINT USING "& _ _ & " ; A\$ RUN J

ABCDEF 10 A\$ = "XY" 20 PRINT USING "& ____&"; A\$ RUN J XY

(3) String constant output function

When any character other than those described above is included in the format string of a PRINT USING statement, that character is displayed together with the value specified following the semicolon.

Enter another arbitrary

(Example:) 10 A = 123 20 PRINT USING "DATA####" ; A RUN J DATA_123

(4) Separation of USING

Usually, PRINT and USING are specified adjacent to each other; however, it is possible to use them separately within the same statement.

(Example:) 10 A = -12 : B = 14 : C = 12 20 PRINT A; B; USING "####" ;C

Normal PRINT function USING function RUN J -12 14 12

Format		numeric variable	N		(numeric variable	1
Tormat	er strings, i					
	INPUT	string variable	\rightarrow or I	NPUT "character strir	ng"; { string variable	1
		array element	layed.	specified to be disp	array element]
				(Example:)		
	INPUT	ГА		INPUT "DATA	A A=:";A	
	INPUT	Г В\$	2A : "1"	INPUT "YES	OR NO"; B\$	
	INPUT	Г Х(5)		INPUT "KEY	N∥;X (5)	

Function

INPUT is one of the statements which is used for entering values for assignment to variables during program execution. Program execution pauses when an INPUT statement is encountered to allow values to be typed in from the keyboard. After input has been completed, the values are substituted into specified variables by pressing the $|\overline{CR}|$ key, then program execution resumes.

(Example:) 1Ø 2Ø C = A + BЗØ PRINT C END CALLS & DUILD THINK OF 4Ø

When the program above is executed, a question mark is displayed and the cursor blinks to indicate that the computer is waiting for data input; enter any arbitrary number, then press the CR key. This assigns the value entered to variable A.

After doing this, the question mark will be displayed again. The reason for this is that two variables (A and B) are specified in the INPUT statement on line 10, but only one value has been entered (that which is substituted into variable A). Enter another arbitrary number and press the CR key again; this substitutes the second value entered into variable B and causes execution to go on to the next line of the program. In the example above, subsequent lines add the values of A and B, substitute the result into C, then display the contents of C.

Since the variables used in this example are numeric variables, the computer will display the message ILLEGAL DATA ERROR if an attempt is made to enter any characters other than numerics. The question mark is then redisplayed to prompt the user to reenter a legal value (a value whose type is the same as that of the variable or array element into which it is to be substituted). Be sure to enter data whose type matches that of the variable(s) specified in the INPUT statement.

During program execution, it may be difficult to remember what data is to be entered when the question mark is displayed; therefore, prompt strings are usually included in INPUT statements for display on the screen as a reminder. This is done as shown in the program example below.

```
1Ø
  INPUT "B="; B
2Ø
  PRINT "A+B=";A+B
ЗØ
40 PRINT "A-B="; A-B
50 PRINT "AXB=";AXB
60 PRINT "A/B=";A/B
7Ø
  END
```

Try running the program shown above. Inclusion of character strings in the PRINT and INPUT statements provides a clear indication of the program's operation. Practical computer programs consist of combinations of sequences similar to the one shown here. By combining commands, statements, and sequences in different manners, you will soon find that there are many different methods of achieving a desired result.

2.3.5.4 GET

THIS KALL

GET v

Format

Function

v..... Numeric variable or array element, or string variable or array element. When this statement is encountered during program execution, the BASIC interpreter checks whether any key on the keyboard is being pressed and, if so, assigns the corresponding value to the variable specified in v. Whereas the INPUT statement prompts for entry of data and waits until that data has been entered before resuming execution, the GET statement continues execution regardless of whether any key is being pressed.

Although data is substituted into variable v by the GET statement if any keys are pressed when the statement is executed, the variable will be left empty (0 for a numeric variable or null for a string variable) if no keys are pressed.

With numeric variables, this statement allows a single digit (from 0 to 9) to be entered; with string variables, it allows a single character to be entered.

This statement can be extremely useful when you want to enter data without pressing the $|\overline{CR}|$ key, as is often the case with game programs.

(Example:)
1Ø PRINT "NEXT GO? (Y OR N) "
2Ø GET A\$
3Ø IF A\$= "Y" THEN 5Ø..... In the example above, execution jumps from line 30 to line 50 if the value of variable A\$ is "Y".
4Ø GOTO 2Ø...... Line 40 unconditionally transfers exe-5Ø PRINT "PROGRAM END" cution to line 20.
6Ø END

> This program displays the prompt "NEXT GO? (Y OR N)" and waits for input. When the Y key is pressed, execution moves to line 50 and the program ends. Until that time, however, execution loops repeatedly between lines 20 and 40. Now delete lines 30 and 40 and try executing the program again. As you can see, execution is completed immediately regardless of whether any keys have been pressed.

> Note: When GET statements are executed in succession, a routine should be included between them to ensure that each is completed before going on to the next. The reason for this is that key chatter (vibration of the contacts of the key switches) may result in two GET statements being executed simultaneously.

2. 3. 5. 5 READ ~ DATA	shown above. Inclusion.	(abbreviated format: REA. ~)	DA.)
Format READ	numeric variable	numeric variable	>
ions of sequences similar to the	string variable	string variable	
sents, and sequences in different	array element	array element	
different methods of achieving	find that there are many		
DATA	numeric constant	numeric constant	>
	string constant	string constant	

Function

Like the INPUT and GET statements, the READ statement is used to submit data to the computer for processing. However, unlike the INPUT and GET statements, data is not entered from the keyboard, but is stored in the program itself in DATA statements. More specifically, the function of the READ statement is to read successive items of data into variables from a list of values which follows a DATA statement. When doing this, there must be a one-to-one correspondence between the variables of the READ statements and the data items specified in the DATA statements.

(Example 1) 10 READ A, B, C, D 20 PRINT A;B;C;D 30 END 40 DATA 10, 100, 50, 60 RUN J

> 100 50 60In this example, values specified in the DATA statement are read into variables A, B, C, and D by the READ statement, then the values of those variable are displayed.

(Example 2) 10 READ X\$, A1, Z\$ 20 PRINT X\$; A1; Z\$ 30 END

40 DATA A, 1, CAs shown by the example below, string data included in DATA statements does not need to be enclosed in quotation marks.

> The READ statement in this example picks successive data items from the list specified in the DATA statement, then substitutes each item into the corresponding variable in the list following the READ statement.

tements are executed in succession, a routine should be includem to ensure that each is completed before going on to the on for this is that key chatter (vibration of the contacts of less) may result in two GET statements being executed simul-

ed immediately regardless of whether any keys have been

execution loops repeatedly numbers lines 20 and 40.

10

(Example 3)

Silling and an and a start and a start a
1Ø DIM A (2) al anotzan to anotzan
20 READ A (0), A (1), A (2)
30 PRINT A (Ø); A (1); A (2)
4Ø END
50 DATA 3, 4, 5
RUN J
3 4 5 The READ statement in this progra
substitutes the numeric values followi
the DATA statement into array element
A(0), $A(1)$, and $A(2)$, then the PRIN
statement on line 30 displays the valu

(Example 4) 1Ø READ A 2Ø READ B 3Ø DATA X

The example above is incorrect because (1) a numeric variable is specified by the READ statement on line 10, but the value specified following the DATA statement is a string value, and (2) there is no data which can be read by the READ statement on line 20.

of those array elements.

An error will result if the number specified in Ln is the number of non-existent line

10 X=33*RND (1) 20 FOR A=1 TO 5 30 READ MS 40 PRINT TAB (3) : • • : TAB (X) :MS 50 PRINT TAB (3) : • • : TAB (X) :MS 50 PRINT TAB (37) : • • : 70 Y=10*RND (1) 80 PRINT TAB (2) : • • : 100 PRINT TAB (2) : • • : 100 PRINT TAB (37) : • • : NEXT 100 PRINT TAB (37) : • • : 120 DATA ' ZON' • SSSSE 130 DATA ' ZON' • SSSSE

.....

Note: See page 62 for the TAB function and page 47 for the FOR ... NEXT statement

2.3.5.6 RESTORE RES.) **RESTORE** or **RESTORE** Ln Format When READ statements are executed, a pointer managed by the BASIC interpreter Function is incremented to keep track of the next item of data to be read from DATA statements. The RESTORE statement resets this pointer to (1) the beginning of the first DATA statement in the program or (2) the beginning of the DATA statement on a specified line. Example 10 DATA 1, 2, 3 20 DATA "AA", "BB" 30 READ X, Y 40 READ Z, V\$statement.on.lino.30 displays the values 100 RESTORE 11Ø READ A, B, C, D\$, E\$ minimum. The example character is incorrect because 200 READ I, J 21Ø RESTORE 220 READ M, N 23Ø RESTORE 26Ø 24Ø READ O, P 250 DATA 1, 2, 3, 4 260 DATA -1, -2, -3, -4 An error will result if the number specified in Ln is the number of non-existent line. This function creates random 1Ø X=33*RND(1) numbers (see page 72). 2Ø FOR A=1 TO 15 30 READ MS TAB (∅); '♦"; TAB (X); M\$; 40 PRINT 50 PRINT TAB (37); * • * 60 NEXT A 7Ø Y=1Ø*RND(1) 80 FOR A=1 TO Y 9Ø PRINT TAB (Ø) ; "♦" ; TAB (37); "♦":NEXT 100 PRINT 11Ø RESTORE: GOTO 1Ø 120 DATA" 130 DATA" 2622 ° . " • 2222 • 14Ø DATA"

Note: See page 62 for the TAB function and page 47 for the FOR ... NEXT statement.

2.3.6 Loop and branch instructions

FOR cv = iv TO fv < STEP sv >Format

NEXT < cv >

.

cv Control variable; a numeric variable or array element.

iv Initial value; a numeric expression.

fv Final value; a numeric expression.

sv Increment, or step value; a numeric expression (if omitted, 1 is assumed).

Function

This statement repeats the instructions between FOR and NEXT a certain number of times.

```
1 \varnothing A = \varnothing
```

20 FOR N=0 TO 10 STEP 2

 $3\emptyset A=A+1$

40 PRINT "N = ";N.

- 50 PRINT "A=":A
- 6Ø NEXT N
- (1) In the program above, 0 is assigned to N as the initial value.
- (2) Next, lines 20 through 50 are executed and the values of variables A and N displayed.
- (3) In line 60, the value of N is increased by 2, after which the BASIC interpreter checks to see whether N is greater than 10, the final value. If not, lines following line 20 are repeated.

When the value of N exceeds 10, execution leaves the loop and subsequent instructions (on lines following line 60) are executed. The program above repeats the loop 6 times.

If \leq STEP sv > is omitted from the statement specification, the value of N is increased by 1 each time the loop is repeated. In the case of the program above, omitting < STEP sv > in this manner would result in 11 repetitions of the loop.

FOR . . . NEXT loops may be nested within other FOR . . . NEXT loops. When doing this, inner loops must be completely included within outer ones. Further, separate control variables must be used for each loop.

Example

1Ø FOR X=1 TO Q Inner loop FOR Y=1 9 Outer loop 2Ø TO 30 PRINT X*Y; 40 NEXT Y-5Ø PRINT 60 NEXT X 70 END

	A = 1		3 -	
FOR FOR	B=1	ТО	5 7	
FOR	C=1	ТО	7	
NEXT	- C -			
NEXT	в —	SV		NEXT
NEXT	- A	1145	E Bu	C, B, A

When loops C, B, and A all end at the same point as in the example above, one NEXT statement may be used to indicate the end of all the loops.

Incorrect example:

FOR	J=1	ТО	1Ø		FOR	= 1	TO	1Ø
FOR	J=K	ТО	K+S	0.1	FOR	J=K	ТО	K+5
NEXT	J		SO are	nen	-NEX-	Emit Lixe		
					-NEX			

× Different control variables× Loops may not cross onemust be used in each loop.another.

Note

The syntax of BASIC does not limit the number of levels to which loops may be nested; however, space is required to store return addresses for each level, so the number of levels is limited by the amount of available free space.

The CLR statement (see page 59) cannot be used within a FOR . . . NEXT loop.

2. 3. 6. 2 GOTO (abbreviated format: ... G.)

GOTO Ln

Format	ł
10	

Ln Destination line number

Function T

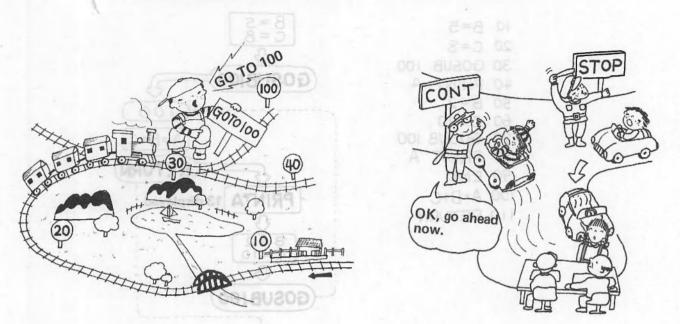

This statement unconditionally transfers program execution to the line number specified in Ln. If Ln is the number of a line which contains executable statements (statements other than REM or DATA statements), execution resumes with that line; otherwise, execution resumes with the first executable statement following line number Ln.

Example

1Ø N=1

20 PRINT N 30 N=N+1

4Ø GOTO 2Ø Transfers program execution to line 20. 5Ø END Since execution of the program shown above will continue indefinitely, stop it by pressing the SHIFT and BREAK keys together (this may be done at any time to stop execution of a BASIC program). To resume execution, execute the CONT J command.

Function

The line number specified in a GOTO statement may not be that of a line included within a FOR ... NEXT loop.

2. 3. 6. 3 GOSUB ~ RETURN \dots (abbreviated format: GOS. ~ RET.) **GOSUB** Ln Format

RETURN

Ln... Destination line number

The GOSUB statement unconditionally transfers program execution to a BASIC subroutine beginning at the line number specified in Ln; after execution of the subroutine has been completed, execution is returned to the statement following **GOSUB** when a RETURN statement is executed.

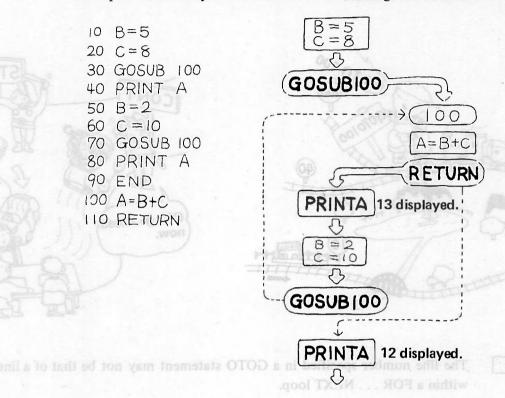

> GOSUB ~ RETURN statements are frequently used when the same processing is required at several different points in a program. In such cases, a subroutine which performs this processing is included at some point in the program, and execution is branched to this subroutine at appropriate points by means of the GOSUB statement. After the required processing has been completed, execution is returned to the main routine by the RETURN statement.

Example

1ØØ	X=1Ø
	GOSUB 200 -
12Ø	PRINT X
13Ø	END
200	X=X*2
21Ø	RETURN

The syntax of BASIC imposes no limit on the extent to which subroutines can be nested (that is, on the number of levels of subroutine calls which can be made from other subroutines); however, in practice a limitation is imposed by the amount of free space in memory which is available for storing return addresses.

2. 3. 6. 4 IF ~ THEN Format IF e THEN L \dots (abbreviated format: \dots IF ~ TH.)

IF e THEN Ln IF e THEN statement

e: A relational expression or logical expression

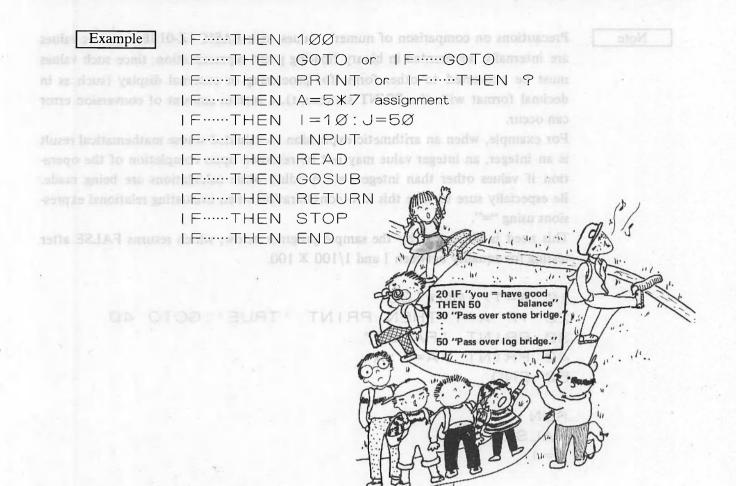

cution is returned to

Ln: Destination line number IF ... THEN statements are used to control branching of program execution accord-

ing to the result of a logical or relational expression. When the result of such an expression is true, statements following THEN are executed. If a line number is specified following THEN, program execution jumps to that line of the program if the result of the expression is true.

If the result of the logical or relational expression is false, execution continues with the program line following that containing the IF . . . THEN statement.

IF	Condition	THEN	Statement or line number
----	-----------	------	--------------------------

Examples of logical and relational expressions

A = 1" are displayed as the result of this pro-

	Operator	Sample application	Explanation
-	112 P_01064	IF A=X THEN…	If the value of numeric variable A equals the value of X, execute the statements following THEN.
su	EN PR	IF A\$="XYZ" THEN…	If the contents of string variable A\$ equal "XYZ", execute the statements following THEN.
expressions	>	IF A>X THEN	If the value of variable A is greater than X, execute the statements following THEN.
	<	IF A <x td="" then…<=""><td>If the value of variable A is less then X, execute the statements following THEN.</td></x>	If the value of variable A is less then X, execute the statements following THEN.
slaticnal	<> or ><	IF A<>X THEN	If the value of variable A is not equal to X, execute the statements following THEN.
R	>= or =>	IF A>=X THEN…	If the value of variable A is greater than or equal to X, execute the statements following THEN.
	<= or =<	IF A<=X THEN	If the value of variable A is less than or equal to X, execute the statements following THEN.
pressions	*	IF(A>X)*(B>Y) THEN···	If the value of variable A is greater than X and the value of variable B is greater than Y, execute the statements following THEN.
Logical expressions	+	IF(A>X)+(B>Y) THEN…	If the value of variable A is greater than X or the value of variable B is greater than Y, execute the statements following THEN.

Note

Precautions on comparison of numeric values with BASIC 1Z-013B, numeric values are internally represented in binary floating point representation; since such values must be converted to other forms for processing or external display (such as in decimal format with the PRINT statement), a certain amount of conversion error can occur.

For example, when an arithmetic expression is evaluated whose mathematical result is an integer, an integer value may not be returned upon completion of the operation if values other than integers are handled while calculations are being made. Be especially sure to take this into consideration when evaluating relational expressions using "=".

This need is illustrated by the sample program below, which returns FALSE after testing for equality between 1 and $1/100 \times 100$.

1Ø A=1/1ØØ*1ØØ 20 IF A=1 THEN PRINT "TRUE":GOTO 40 30 PRINT "FALSE" 40 PRINT "A=";A 5Ø END

RUN FALSE A = 1

The fact that both "FALSE" and "A = 1" are displayed as the result of this program showns that external representation of numbers may differ from the number's internal representation.

Therefore, a better method of checking for equality in the program example above is as follows.

20 IF ABS (A Goto 40	A-1) < .1E-8 TH	HEN PRI	NT "TRUE":
If the value of variable A is greater than X, execute the statements following THEN.			
		.>	
If the value of variable A is greater than X or the value of variable B is greater than Y, execute the statements following THEN.			

Format	IF e GOTO Lr
	e: Relational expression or logical expression
	Lr: Destination line number and not subset to ball the line in the
Function	branching; when the specified condition is satisfied, program execution jumps to
	with the next line of the program. (Any statements following IF \sim GOTO on the same program line will be ignored.)
Example	$1 \emptyset$ G= \emptyset : N= \emptyset C C C C C C C C C C C C C C C C C C C

2.3.6.8 ON~G	OSUB	
Format	ON e GOSUB $Lr_1 < , Lr_2, Lr_3, \ldots, Lri >$	

Format

e . . . Numeric variable, array element, or expression Lri . Destination line numbers

Function

This statement branches execution to the subroutine beginning on one of the line numbers following GOSUB, depending on the value of e. Operation of this statement is basically the same as with the ON~GOTO statement, but all branches are made to subroutines. Upon return from the subroutine, execution resumes with the first executable statement following the ON~GOSUB statement which made the call.

Example

Let's try using the ON~GOSUB statement in a scheduling program. The most important point to note in the following program is that, a subroutine call is made at line 180, even though line 180 itself is part of a subroutine (from line 170 to 190) which is called by line 90. Subroutines can be nested to many levels in this manner.

":B\$=" MATH ": C\$=" 1Ø A\$=" П ENGL FREN SCI ":E\$=" MUS ":F\$=" 2Ø D\$=" GYM ": H\$=" ART ": |\$=" 3Ø G\$=" п HIST GEOG ":K\$=" H RM ":PRINT"**@**" 4Ø J\$=" BUS INPUT "WHAT DAY?"; X\$ 5Ø 6Ø FOR Z=1 TO 7:Y\$≕MID\$("SUNMONTUEWEDTHU FRISAT", 1+3*(Z-1), 3) : IF Y\$=X\$ THEN X=Z 7Ø NEXT Ζ 80 FOR Y=0 to 4: print tab(5+6*Y); Y+1; 90 NEXT Y:PRINT 100 ON X GOSUB 180,120,130,140,150,160,170 11Ø PRINT: GOTO 50 12Ø PRINT MON "; A\$; B\$; D\$; G\$; K\$: RETURN 13Ø PRINT "TUE "; B\$; E\$; H\$; H\$; D\$: RETURN 14Ø PRINT "WED ";C\$;C\$;I\$;A\$;F\$:RETURN 15Ø PRINT"THU "; B\$; D\$; F\$; G\$; E\$: RETURN 16Ø PRINT"FRI ";A\$;D\$;I\$;C\$;C\$:RETURN 17Ø PRINT"SAT "; B\$; G\$; D\$; K\$: RETURN 180 FOR Y=1 TO 6 190 ON Y GOSUB 120, 130, 140, 150, 160, 170 200 PRINT:NEXT Y 21Ø RETURN

consist of combinations of functions which are intrinsic to BASIC.

2.3.7 Definition statements

2.3.7.1 DIM

Format

) "Illoilloid (Elle 'orogine's pronumer ' ' a
DIM a_1 (i_1) < , a_2 (i_2)	, ai (im) >
DIM $b_1(i_1, j_1) < , b_2$	$(i_2, j_2), \dots, i_n, j_n) > 0$
ai	. 1-dimensional array name (list)
bi	. 2-dimensional array name (table)
Inc ON~GO CI COMPLET	Dimonsions

im, in, jn Dimensions

Function

This statement is used to declare (define) arrays with from one to four dimensions and to reserve space in memory for the number of dimensions declared (DIM: dimension). Up to two characters can be specified as the array name, and subscripts of any value may be specified to define the size of dimensions; however, the number of dimensions which can be used is limited in practice by the amount of free memory available.

Example

(2	inpress)	
1Ø	DIM A (1ØØ)	
2Ø	FOR J=Ø TO 1ØØ	
ЗØ	READ A (J)	
4Ø	NEXT J	
5Ø	DATA 5, 3Ø, 12,	

(Examples:)

(Examples:)

1Ø	DIM A\$ (1), B\$ (1), C\$ (1)
2Ø	FOR J=Ø TO 1 : READ A\$ (J), B\$ (J)
ЗØ	C\$(J) = A\$(J) + " " + B\$(J)
4Ø	PRINT A\$ (J), B\$ (J), C\$ (J)
5Ø	NEXT J
6Ø	END OS LOS LABOR AUROR X NO DO
70	

70 DATA YOUNG, GIRL, WHITE, ROSE

Execution of the DIM statement sets the values of all elements of declared arrays to 0 (for numeric arrays) or null (for string arrays). Therefore, this statement should be executed before values are assigned to arrays.

Different names must be used for each array which is declared; for example, the instruction DIM A(5), A(6) is not a legal array declaration.

All array declarations are nullified by execution of a CLR statement (see page 59) and a NEW statement (see page 32).

2.3.7.2 DEF FN

Format

Note

DEF FN f(x) = e

f ... Name assigned to the function being defined (one uppercase letter from A to Z)

- x . . . Argument (variable name)
- e... Numeric expression (constant, variable, array element, or function) or previously defined user function

Function

The DEF FN statement is used to define user function FN f (x). Such functions consist of combinations of functions which are intrinsic to BASIC.

Example	DEF FNA (X) = $2 \times X \uparrow 2 + 3 \times X + 1$ Defines $2X^2 + 3X + 1$ as FNA (X).
	DEF FNE (V) =1/2*M*V \uparrow 2 ····· Defines 1/2MV ² as FNE (V). 1Ø DEF FNB (X) =TAN (X – PA (1) \checkmark 6) 2Ø DEF FND (X) =FNB (X)/ C+X··Defines function FNB using the function defined on line 10.
	(Incorrect definitions) $1 \emptyset$ DEF FNK (X)=SIN (X/3+PAI(1)/4), FNL (X)=EXP(-X↑2/K) Only one user function can be defined by a single DEF FN statement.
	Find the kinetic energy of a mass of 5.5 when it is imparted with initial accelerations of 3.5 , 3.5×2 , and 3.5×3 .
	1Ø DEF FNE (V) =1/2*M*V↑2
	20 M=5.5:V=3.5
	3Ø PRINT FNE(V), FNE(V*2), FNE(V*3) 4Ø END
Note	All user function definitions are cleared when the CLR statement and the NEW statement is executed.
2. 3. 7. 3 DEF KEY	40 PAINT C
Format	DEF KEY $(k) = S$
	k Definable function key number (1 to 10) S\$ Character string (up to 15 characters).
Function	Character strings can be assigned to any of the ten function keys to allow strings to be entered at any time just by pressing a single key. This statement is used to
	define such strings and assign them to the definable function keys. Function key numbers 1 to 5 are entered just by pressing the corresponding key at the top left corner of the keyboard; keys 6 to 10 are entered by pressing the <u>SHIFT</u> key together with the corresponding key. The function key number (1 to 10) is specified in k, and the string or command which is to be assigned to the key is specified exactly as it is to be entered in S\$. Execution of the DEF KEY statement cancels the previous definition of the definable function key. No other statement can be specified after a DEF KEY statement on the same line.
	(Example:) $1 \emptyset$ DEF KEY (1) = " NPUT " Defines key F1 as INPUT $2\emptyset$ DEF KEY (2) = " RUN " + CHR\$(13) Defines F2 as RUN J

Note: CHR\$ (13) indicates the ASCII code for $\overline{|CR|}$, and specifying it together with the string assigned to a definable function key has the same effect as pressing the $|\overline{CR}|$ key. (See the description of the CHR\$ function on page 78 and the ASCII code table on page 154.)

2.3.8 Remark statement and control commands

2. 3. 8. 1 REM

Format	KEWI r	10 DEF FNB (X) =TA 20 DEF FND (X) =FN
Function	the BASIC interpreter to ign are non-executable, they ma affecting the results of execu	tement which is specified in a program line to cau ore the remainder of that line. Since REM statemer ay be included at any point in the program witho ution. REM statements are generally used to make add explanatory notes to a program.
When more the separated from generally the	n the one preceding it by a c	on a single program line, each statement must be colon (:). Operation of the BASIC interpreter is a same statements are specified on different lines. the exactly the same result.
	+ B $ = 10 A $ $ = 10 A$	=5:B=8:C=A*B:PRINT C y differ when multiple statement lines are used as
shown		
2Ø E 3Ø 4Ø F	B=Ø IF 99 <a b="1<br" then="">PRINT B END	line 10 is greater than or equal to 100, and 0 if the value entered is less than 100.
2Ø 6	INPUT A:B=Ø:IF S End	99 <a b="1:PRINT" b<="" td="" then="">
at all in	f the value entered is less than	ntered is greater than or equal to 100, but nothing 100. The reason for this is that statements follow- if the IF condition is not satisfied.

Note: CHR\$ (13) indicates the ASCII code for[CR] and specifying it together with the string assigned to a definable function key has the same effect as pressing the [CR] key. (See the description of the CHR\$ function on page 78 and the ASCII code table on page 154.)

2. 3. 8. 2 STOP (abbreviated format: S.)

Emation
Function

STOP

Temporarily stops program execution, displays BREAK and READY, then waits for entry of executable commands in the direct mode.

The STOP statement is used to temporarily interrupt program execution, and may be inserted at as many points and locations in the program as required. Since execution of the program is only interrupted temporarily, the PRINT statement can be used in the direct mode to check the values stored in variables, after which execution can be resumed by entering CONT J.

Example

1Ø	READ A. B. State of Long to the second
2Ø	X=A*B
ЗØ	STOP MA 22.00.9 al smit sitt . 220090
4Ø	Y=A/B
5Ø	PRINT X, Y
6Ø	DATA 15, 500 and solutions and solutions
7Ø	END COCOEL = 211
RUN	The clock is set to 7:00:00 and then restarted autoril
BRE	EAK IN 30

Note

Unlike the END statement, no files are closed by the STOP statement. (See page 68 concerning procedures for opening and closing of files.)

2.3.8.3 END

Format	
Function	1

(abbreviated format: E.)

END

The END statement terminates program execution and returns the BASIC interpreter to the command mode for input of direct mode commands. When this statement is executed, READY is displayed to indicate that the BASIC interpreter is ready. After the END statement has been executed, execution cannot be resumed by executing the CONT command even if there are executable statements on program lines following the END statement.

Note

All open files are closed when the END statement is executed. (See page 68 concerning procedures for opening and closing files.)

Differences between the STOP and END statements

》 注于百名	Screen display	Files	Resumption of execution
STOP	BREAK IN XXXX READY	Open files are not closed.	Can be resumed by executing CONT.
END	READY	Open files are closed	Cannot be resumed.

2.3.8.4 CLR

Format
Function

CLR

The CLR command clears all variables and cancels all array definitions. All numeric variables are cleared to 0, and null strings ("") are placed in all string variables; arrays are eliminated entirely by nullifying all previously executed DIM statements. Therefore, DIM statements must be executed to redefine the dimensions of required arrays before they can be used again.

The CLR command also cancels all function definitions made with the DEF FN statement; therefore, it is also necessary to reexecute DEF FN statements to redefine such functions before they can be used again.

CLR statements cannot be included in a FOR~NEXT loop or BASIC subroutine.

Note

2.3.8.5 TI\$

	Format
Ĩ	Function

Example

TI\$ "hh mm ss" parametri vico ai mergore sel to notico a

TI\$ is the name of the system string variable which contains the time of the computer's built-in clock.

This built-in variable is automatically incremented once each second, and the six character string contained in this variable indicates the hour, minute, and second, with two characters used for each. For example, if the string contained in TI\$ is "092035", the time is 9:20:35 A. M.

Variable TI\$ is automatically set to 00:00:00 when BASIC is loaded into the computer. To set the current time of day, use the string assignment statement. For example, the clock can be set to 7:00:00 P. M. by executing the following.

TI\$ = "190000"

The clock is set to 7:00:00 and then restarted automatically when the CR key is pressed.

The digits specified for the hour must be in the range from 00 to 23, and those specified for the minute and second must each be in the range from 00 to 59. The following program displays the current local time in various cities of the world.

10 PRINT "O"

20 DIM C\$ (10), D (10), E (10), T\$ (10) 30 FOR I=1 TO 10:READ C\$ (I), D (I) :NEXT I 40 PRINT"ENTER NEW YORK TIME (HOUR, MINUT

5Ø INPUT B\$:TI\$=B\$:PRINT"@"

6Ø PRINT "■":T\$(1)=TI\$

7Ø FOR I=1 TO 1Ø de dia si si volo sol

8Ø E(|)=VAL(LEFT\$(T\$(1), 2))+D(|)

 $9\emptyset$ IF E(I) = 24 THEN E(I) = \emptyset

100 IF E(I) <0 THEN E(I) =24+E(I)

110 T\$ (I) = STR\$ (E (I)) + R | GHT\$ (T\$ (1), 4)

120 IF LEN(T\$(I))=5 THEN T\$(I)="0"+T\$(I)

13Ø PRINT C\$ (I); TAB (15); LEFT\$ (T\$ (I), 2);

14Ø PRINT": ";MID\$(T\$(I), 3, 2); ": ";RIGHT\$(T\$(I), 2);

150 NEXT I:GOTO 60

160 DATA NEW YORK, Ø, MOSCOW, 8, RIO DE JANE IRO, 2

170 DATA SYDNEY, 15, HONOLULU, -5, LONDON, 5, CAIRO, 7

180 DATA TOKYO, 14, SAN FRANCISCO, —3, PARIS . 6

variables are cleared to 0, and null strings (' ') are placed in all string variables arrays are eliminated entirely by nullifying all previously executed DIM statements. Therefore, DIM statements must be executed to redefine the dimensions of required proves before they can be used again. Note

The TI\$ variable cannot be specified in an INPUT statement. Further, after the time changes from 23:59:59 to 00:00:00, the time "00:00:01" is not displayed.

	L'aura at	
	Format	- 1.
_	I OIMut	- 11

CURSOR x, y x... X coordinate (0 to 39)

y... Y coordinate (0 to 24) and a congress of benefits a shift)

Function

This command is used to move the cursor to a specified position on the TV (display) screen, and can be used together with the PRINT and INPUT statements to display characters in any desired location.

In the system of screen coordinates used, the columns of the screen are numbered from left to right, starting with 0 on the left side and ending with 39 on the right side; lines of the screen are numbered from top to bottom, with 0 indicating the top line of the screen and 24 indicating the bottom line. Thus, the cursor can be moved to any desired position in the range from (0, 0), which indicates the top left corner of the screen, to (39, 24) indicates the bottom right corner.

Example

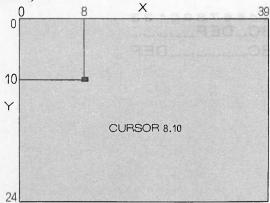

The following program moves an asterisk (*) about on the screen as the cursor keys are pressed.

1Ø	X = x	Ø:Y=Ø					
15	PR	INT " 🖻 "					
2Ø	CUF	RSOR X,	Y:PRI	VT"*";			2, 3, 8, 8
ЗØ	GE-	F A\$:IF	A\$="	" THEN	ЗØ		
4Ø	CUF	RSOR X.	Y:PRIM	VT" ";	(II) U		
5Ø	IF.	A\$=" I "	THEN	Y=Y-1	:REM	"UP	11
6Ø	ΙF	A\$=" 1 "	THEN	Y=Y+1	:REM	" DOWN	н
7Ø	IF	A\$="∎"	THEN	X = X - 1	:REM	"LEFT	II
8Ø	IF	A\$="∎"	THEN	X = X + 1	:REM	"RIGHT	
9Ø	IF	X<Ø	THEN	X=Ø			
		= Y<Ø		Y=Ø			
110	ð i f	= X>38	THEN	X=38			
120	ΣIF	= Y>24	THEN	Y=24			
150	Ø GC	DTO 2Ø					

Note

If the value specified for either X or Y is other than an integer, it is converted to an integer by truncating the decimal portion before the cursor is moved.

Other methods of moving the cursor which are used together with the PRINT statement include the TAB and SPC functions. (See page 62 for a description of the SPC function.)

61

	Mole The TIS variable cannot be specified in an INPUT statement. Fu
Format	TAB (x) 00.00 and add 00.00.00 of 92.92.52 most asgreed
	x A numeric expression
Function	The TAB function is used together with the PRINT statement to move the cursor to the character position which is $x + 1$ positions from the left side of the screen. (This is referred to as space tabulation.)
Example	PRINT TAB (5); "XYZ"; TAB (1 \emptyset); "ABC" 0123456789012 \leftarrow Not actually displayed. XYZABC
Note	Tabulation can only be used to move the cursor to the right; therefore, nothing happens if this function is used together with the PRINT statement when the cursor is already to the right of the character position specified in (x) .
	(Example:) PR NT TAB (5) ; "XYZ" ; TAB (5) ; "ABC"
	01234567890 XYZABC
2. 3. 8. 8 SPC	
Format	SPC (n) SE MEHT PERA EL 2A TEO SE
	n A numeric expression
Function	Use together with the PRINT statement, this function outputs a string of n spaces and thus moves the cursor n character positions to the right of its current position.
Example	(Example 1) PRINT SPC (5); "ABC"
	01234567 ABC
	(Example 2)
	an integer by truncating the decimal portion before the c.snoit a
	1Ø ? TAB(2); "ABC"; TAB(6); "DEF" 2Ø ? SPC(2); "ABC"; SPC(6); "DEF"
	01234567890123 ABC.DEF
	ABCDEF
	VIEROPEO

2.3.8.9 SET, RESET

Drawing a rectangle around the edge of the screer

These statements are used to turn dots on or off at a specified position on the screen.

Format	Function	Range of X, Y coordinates
 SET X, Y < , C > X Numeric expression specifying the X coordinate. Y Numeric expression specifying the Y coordinate. C Color code (0 to 7). 	Turns on the dots at the screen coordinates specified by X and Y. (SET)	$\begin{array}{l} 0 \leq X \leq 79 \\ 0 \leq Y \leq 49 \end{array}$
 RESET X, Y X Numeric expression specifying the X coordinate. Y Numeric expression specifying the Y coordinate. 	Turns off the dots at the screen coordinates specified by X and Y. (RESET)	$\begin{array}{c} 0 \leq X \leq 79 \\ 0 \leq Y \leq 49 \end{array}$

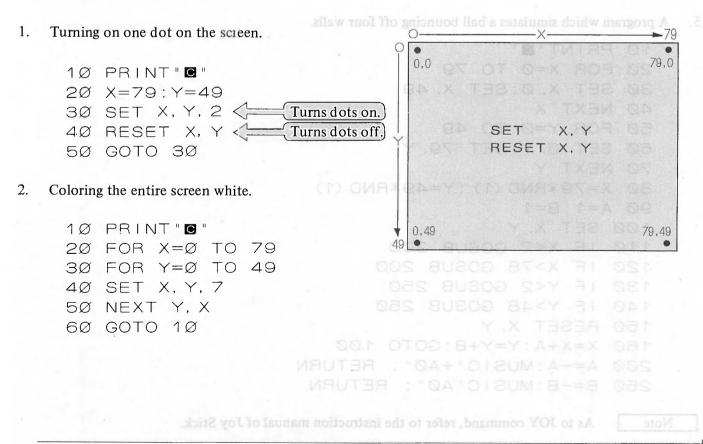

When a color code is specified, the color of the dots displayed by the SET statement is as follows.

(0) Black

- (1) Blue
- (2) Red
- (3) Purple
- (4) Green
- (5) Light blue
- (6) Yellow
- (7) White

Since four dots are turned on simultaneously by the SET statement, changing the color of any one dot in that four dot group also causes the color of the other dots to change.

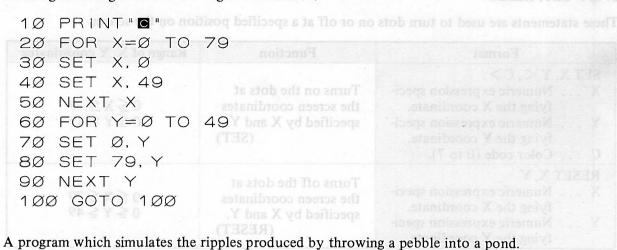

The SET and RESET statements can be use to produce a wide variety of interesting effects; some examples are introduced below.

-63

2.3.9 Music control statements

This section discusses the MUSIC and TEMPO statements which are used to control performance of music by the computer. As its name implies, the TEMPO statement specifies the speed with which music is performed. The notes (including half notes and upper and lower octaves) and duration of notes produced are controlled by the MUSIC statement.

Tempo:	Specified with TEMPO as a numeric variable or constant with a value from
	1 (slow) to 7 (fast).
Melody:	Specified with MUSIC as a string variable consisting of a collection of notes.
Note specificat	tion: octave # (sharp) note name duration
2.3.9.1 MUSIC .	(abbreviated format: MU.)
Format	MUSIC X\$ X\$ String data
ied note. The dura- When R is specified.	Automatically performs music.
Discussion	This statement outputs the melody or sound effects specified by the character string or string variable of its argument to the speaker. The speed with which this melody is played is that which is specified with the TEMPO statement (see page 67).
	The format for specification of each note is as follows: < octave specification > < # (sharp) > note name < duration >
	The plus or minus signs are used to specify the octave. If neither is specified, the middle range is assumed.
	inguite colour. For example, the constant of an inconstant of search indicated by
	Low C –C
	Middle C C High C +C

Low

range

Middle

No specification

range

High

range

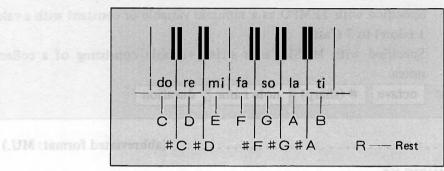

+

Note specification

The symbols used to specify notes within each range are as follows:

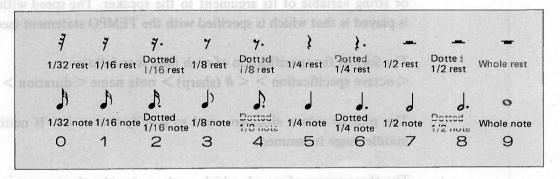

CDEFGAB # R

The relationship between the 8-note scale (do, re, mi, fa, so, la, ti, do) and these symbols are as shown below. The sharp symbol (#) is used to specify half notes. Silent intervals are specified with "R".

Duration specification

The duration specification determines the length of the specified note. The durations from 1/32 to whole are specified as numbers from 0 to 9. (When R is specified, this determines the length of the silent interval.)

When successive notes have the same duration, the duration specification can be omitted for the second and following notes. If no duration is specified for the first note, 1/4 notes are assumed.

Sound volume

The volume of sound produced cannot be controlled by the program, but can be adjusted with the computer's external volume control.

Example

Let's try assigning a string to SR\$ to play the theme from the beginning of Beethoven's Serenade in D major (Opus 25).

SR\$= "+A3+#F1+A+B3A+D+#F1A+D3A+D +#F1A+D3+#F1A+D+E+#F+G+A3R"

2.3.10 Data file input/output commands

Although the SAVE and LOAD commands can be used to write or read program text, other commands are used to record or read the various types of data which is handled by programs. These commands are described below.

MANAGER AND AN OLY	Format	Function
WOPEN (abbreviated W.)	WOPEN < file name >	Opens a data file on cassette tape prior to writing data to it. This command also assigns a name to the data file.
PRINT/T (abbreviated ?/T)	PRINT/T $d_1 < , d_2, d_3, \dots dn > dn \dots$ Numeric data or string data	Writes data to cassette tape in the same format as it would be displayed by the PRINT statement.
ROPEN (abbreviated RO.)	ROPEN < file name >	Searches for the data file on cassette tape with the specified name and opens that file to prepare for reading data from it.
INPUT/T (abbreviated I./T)	INPUT/T $v_1 < v_2, v_3, \dots v_n >$ vn Numeric data or string data	Used to input data from a cassette file and pass it to the program (in a manner similar to that in which the INPUT statement is used to input data from the keyboard).
CLOSE (abbreviated CLO.)	CLOSE 2 M. 2 SM. 2 M. 2M	Statement which closes cassette data files after writing or reading has been completed.

Unlike the LOAD and SAVE commands, no messages are displayed by execution of the WOPEN and ROPEN statements.

If display of a message is desired, use the PRINT statement to define one in the program.

Note: When an ordinary cassette recorder is used, it may not be possible to record data files even if no problems are encountered in storing or reading programs with the SAVE and LOAD commands.

(Example 1) The following program writes the numbers from 1 to 99 on cassette tape. 1Ø WOPEN "DATA" 2Ø FOR X=1 TO 99 3Ø PRINT/T X

- 40 NEXT X
- 5Ø CLOSE

```
6Ø END
```

```
TT
```

(Example 2)

The following program reads data from the data file prepared in Example 1 above. Before executing this program, be sure to rewind the cassette tape.

```
1Ø ROPEN "DATA"
2Ø FOR X=1 TO 99
3Ø INPUT/T A
4Ø PRINT A
5Ø NEXT X
6Ø CLOSE
7Ø END
```

(Example 3) The following program creates a data file consisting of string data.

```
DIM N$ (5)
1Ø
2Ø
   N$(1) = "BACH"
   N$ (2) = "MOZART"
ЗØ
4Ø
   N$ (3) = "BEETHOVEN "
   N$ (4) = "CHOPIN "ON THEOUTS"
50
6Ø
   N$(5) = "BRAHMS"
7Ø
   WOPEN "GREAT MUSICIAN "
8Ø
   FOR J=1
            TO 5
90 PRINT/T
            N$ (J)
100 NEXT J
11Ø CLOSE
12Ø END
```

(Example 4)

The following program reads string data from the file created in Example 3. Before executing this program, be sure to rewind the cassette tape.

200 DIM M\$ (5) 210 ROPEN "GREAT MUSICIAN" 220 FOR K=1 TO 5 230 INPUT/T M\$ (K) 240 PRINT M\$ (K) 250 NEXT K 260 CLOSE 270 END

It is also possible to create data files which include both numeric and string data. However, since an error will occur if the type of data read does not match the type of variable specified in the INPUT/T statement, it is generally best to limit files to one type of data or the other.

Note: It is possible to omit the file name when opening a sequential file with the WOPEN statement. However, this is likely to result in errors if many files are included on the same tape; therefore, it is recommended that you make a habit of assigning file names to sequential data files.

69

The following program records student grades in English, French, science, and mathemetics to a sequential data cassette file.

```
INPUT "ENTER NO. OF STUDENTS" : N
     1Ø
     2Ø
        D \mid M \otimes (N), K (N), E (N)
     30 DIM R (N), S (N)
     40 AS="GRADE IS"
     50 FOR X=1 TO N
     60 PRINT: PRINT "STUDENT NO. / ";X-0 = (...)
     70 INPUT "ENTER STUDENT NAME: ";N$(X)
     80 PRINT "ENG "; A$; : INPUT K (X) ABRO MBROM
     9Ø PRINT "FREN"; A$; : INPUT E(X) OT
     100 PRINT "SCI ";A$;:INPUT R(X)
     110 PRINT "MATH"; A$; : INPUT S(X)
     120 NEXT X
                             Copens data file "GRADES" for output on cassette tape.)
     13Ø WOPEN "GRADES "
                             \langle -Writes the number of students in the class to the file.
     140 PRINT/T N
     150 FOR X=1
                     TO N
                                                        Writes grades
to the file.
160 PRINT/T N$ (X), K (X), E (X), R (X), S (X)
     170 NEXT X
     180 CLOSE
                   \subset Closes the cassette file.)
     19Ø END
```

The following program reads the grade data written to the cassette file by the program shown above, then calculates displays the grade average for each student and class averages for each of the various subjects.

```
ROPEN "GRADES "
                                Copens cassette file "GRADES" for input.
    1Ø
    2Ø
        INPUT/T N
                                <- Reads the number of people in the class.
    30 DIM N$ (N), K (N), E (N)
    40 DIM R(N), S(N)
50 FOR X=1 TO N \sim Reads student names and the grades for
60 INPUT/T N$ (X), K (X)
        INPUT/T E (X), R (X), S (X) Reads the grades for French, science
    7Ø
                                        and mathematics.
    80 NEXT X
9\emptyset CLOSE \leftarrow Closes the file.
100 PRINT TAB(10); "ENG ";
    110 PRINT TAB (15); "FREN':
    120 PRINT
                 TAB (2Ø) ; "SCI
                TAB (25) ; "MATH "
    130 PRINT
    140 FOR X=1
                   TO N
    15Ø
         PRINT
                 N$ (X); TAB (1Ø); K (X);

    25Ø END
```

2.4 Built-in Function

Function	BASIC symbol	Example	Description
Absolute value	ABS (X)	A = ABS(X)	Assigns the absolute value of variable $ X $ to vairable A. Example: $A = ABS (2, 9) \rightarrow A - 2, 9$ $A = ABS (-5, 5) \rightarrow A = 5, 5$
Sign	SGN (X)	$\mathbf{A} = \mathrm{SGN}(\mathbf{X})$	Assigns the numeric sign of variable X to variable A. If the value of X is negative, -1 is assigned to A; if X is 0, 0 is assigned to A; and if X is positive, 1 is assigned to A. A = $\begin{cases} 1 & (X > 0) & \text{Example: 1 is assigned to variable} \\ 0 & (X = 0) & \text{A when A = SGN (0.4)} \\ -1 & (X < 0) & \text{is executed.} \end{cases}$
Integer conver- sion	INT (X)	A = INT (X)	Assigns the greatest integer value to A which is less than or equal to the value of variable X. Examples: $A = INT (3, 87) \rightarrow A = 3$ $A = INT (0, 6) \rightarrow A = 0$ $A = INT (-3, 87) \rightarrow A = -4$
Trigono- metric functions	SIN (X)	A = SIN (X) A=SIN(30 * PAI(1/180)	Assigns the sine of X (where X is in radians) to variable A. If the value of X is in degrees, it must be converted to radians before this function is used to obtain the sine. Since 1 degree equals $\pi/180$ radians, the value in radians is obtained by multiplying the number of degrees by PAI(1)/ 180. For example, $30^\circ = 30 \times PAI(1)/180$ radians. The same applies to the COS, TAN, and ATN functions.
	COS (X)	A = COS (X) A = COS (X) $(200 \times PAI(1)/180)$	Assigns the cosine of X (where X is in radians) to variable A.
	TAN (X)	A = TAN (X) A=TAN(Y*PAI(1)/180)	Assigns the tangent of X (where X is in radians) to variable A.
	ATN (X)	A = ATN (X) A=180/PAI(1) * ATN(X)	Assigns the arctangent in radians of X $(\tan^{-1} X)$ to variable A. The value returned will be in the range from $-PI/2$ to $PI/2$.
Square root	SQR (X)	A = SQR(X)	Calculates the square root of X and assigns the result to variable A. X must be a positive number or 0.
Exponen- tiation	EXP (X)	$\mathbf{A} = \mathbf{E}\mathbf{X}\mathbf{P}\left(\mathbf{X}\right)$	Calculates the value of e^x and assigns the result to variable A.
Common logarithm	LOG (X)	A = LOG (X)	Calculates the common logarithm of X $(\log_{10} X)$ and assigns the result to variable A.
Natural logarithm	LN (X)	A = LN(X)	Calculates the natural logarithm of X (loge X) and assigns the result to variable A.
Ratio of circum- ference to diameter	PAI (X)	A = PAI(X)	Assigns the value to variable A which is X times the value of PI.
Radians	RAD (X)	A = RAD (X)	

lized to start a new series, and the pseudo-random number returned is the first one in that series. Reinitialization of the pseudo-random number series in this manne can be used to allow simulations based on random numbers to be reproduced.

Examples of use of the built-in funcions

(Example 1)

Let's try solving the various elements of a triangle with a BASIC program.

Angle A of the triangle shown in the figure at right is 30° , angle B is a right angle, and side CA has a length of 12. The following program finds all angles of the triangle, the length of its sides, and its total area.

- 10 A = 30:B = 90:CA = 122Ø AB=CA*COS (A*PAI(1)/18Ø) 30 BC=CA*SIN (A*PAI(1)/180) 4Ø S=AB*BC/2 5Ø C=18Ø-A-B (18.2) 101 - A resignad
- 6Ø PRINT "AB="; AB, "BC="; BC, "CA=";CA
- "AREAS=";S 70 PRINT
- 8Ø PRINT "A=";A, "B=";B, "C=";C 9Ø END

=30 CA = 12AB B=90° BC

(Example 2)

Now let's change line 50 of the program to use ATN, the function for finding the arctangent of a number, to fine angle C from sides AB and BC.

1Ø A=3Ø:B=9Ø:CA=12 2Ø AB=CA*COS (A*PAI(1)/18Ø) 3Ø BC=CA*SIN (A*PAI(1)/18Ø) 40 S=AB*BC/2 $5\emptyset$ C=ATN (AB/BC) $\times 18\emptyset$ /PAI(1) "AB=";AB, "BC=";BC, "CA=";CA 60 PRINT "AREAS=";S 70 PRINT 8Ø PRINT "A=";A, "B=";B, "C=";C 9Ø END

RND function

Format

RND (X) X .. Numeric expression

Function

The RND function returns a pseudo-random number in the range from 0.00000001 to 0.99999999.

When X is greater than 0, the random number returned is the one which follows that previously generated by the BASIC interpreter in a given pseudo-random number series. aldernov of thezen and zngizza bos

When $X \ge 0$, the BASIC Interpreter's pseudo-random number generator is reinitialized to start a new series, and the pseudo-random number returned is the first one in that series. Reinitialization of the pseudo-random number series in this manner can be used to allow simulations based on random numbers to be reproduced.

The RND function is often used in game programs to produce unpredicatable numbers, as in games of chance. Let's try using the RND function to investigate the percentage of times each of the six sides of a die comes up by simulating the action of throwing it a given number of times.

Since the sides of each die are numbered from 1 to 6, we must multiply the value returned by the RND function by 6.

$$O < RND(1) < 1 \longrightarrow O < 6 * RND(1) < 6$$

Then we must use the INT function to convert the value obtained to an integer.

The result will be an integer between 0 and 5; now 1 is added to obtain the numbers which correspond to the number of dots on each of the 6 sides of a die.

This sequence is performed a specified number of times for each die thrown. Now let's incorporate the sequence into a program and check the results.

How about it? If the die is thrown enough times, the percentage of the time each number appears should be about the same. Mathematically speaking, each number should occur an average of once in six throws, or about 16.7% of the time. This mathematical ideal is approached more closely as the number of throws is increased.

Example

Now let's try using the RND function in a program which tests your ability to solve for the area of a triangle of random size. Here, the RND function is used to determine the length of each of the three sides of the triangle, then you compute the area of the triangle yourself and submit your answer to the computer for checking.

constant with the STR\$ function is evaluated with the LEN function, a total string

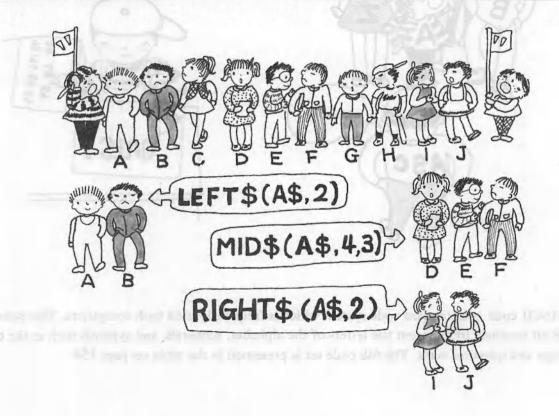

.____

length of 9 is returned.

2.5.2 LEFT\$, MID\$, and RIGHT\$

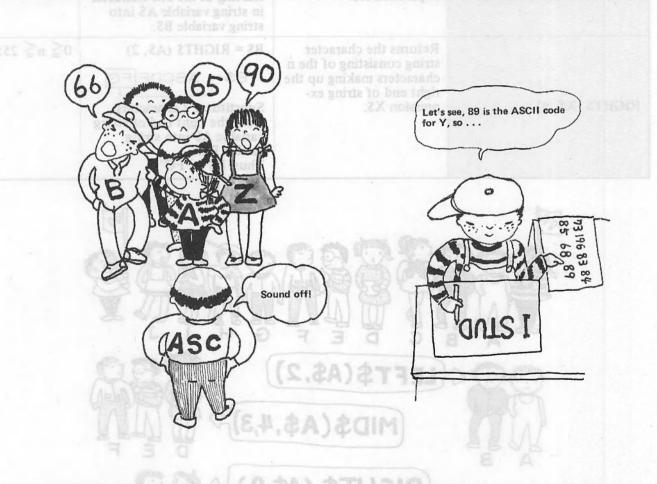

The LEFT\$, MID\$, and RIGHT\$ functions are used to extract character strings from the left end, right end, or middle of a character expression.

Format X\$: String expression m and n: Numeric expressions	Function	Example (when A\$ = "ABCDEFG")	Remarks
LEFT\$ (X\$, n)	Returns the character string consisting of the n characters making up the left of string expression X\$.	B\$= LEFT\$ (A\$, 2) B\$← ABCDEFG Substitutes 2 characters from the left end of string variable A\$ into string variable B\$. Thus, B\$ = "AB".	0≦ n≦ 255
MID\$ (X\$, m, n)	Returns the character string consisting of the n characters making up the n characters starting with the mth character in string expression X\$.	B\$=MID\$ (A\$, 3, 3) B\$← ABCDEFG Substitutes the 3 characters starting at the 3rd character in string variable A\$ into string variable B\$.	$1 \stackrel{\text{l}}{=} m \stackrel{\text{d}}{=} 255$ $0 \stackrel{\text{d}}{=} n \stackrel{\text{d}}{=} 255$
RIGHT\$ (X\$, n)	Returns the character string consisting of the n characters making up the right end of string ex- pression X\$.	B\$ = RIGHT\$ (A\$, 2) B\$ ← ABCDE FG Substitutes 2 characters from the right end of string variable A\$ into string variable B\$. Thus, B\$ = "FG".	0≦ n≦ 255

2.5.3 ASC and CHR\$

Format	Function	Example	
ASC (x\$) x\$: String expression	Returns the ASCII code for the first character in string expression x\$.	X=ASC (" A ") Substitutes 65 (the ASCII code for the letter A) into variable X.	
225 ≥0 ≥0 	the character $BS= LEFTS (AS, 2)$ asisting of the a rs making up the $BS \leftarrow ABCDE$ ring expression	Y=ASC (" SHARP") Substitutes 83 (the ASCII code for S, the first letter in the string "SHARP") into variable X.	
CHR\$ (x) x: Numeric expression	Returns the letter whose ASCII code corresponds to the value of numeric expression X. (No character is returned if the value specified for x is less then 33; therefore, PRINT "" or PRINT SPC (1) should be used to obtain spaces, rather than CHR\$ (32)).	A\$=CHR\$ (65) Assigns A, the letter corresponding to ASCII code 65, to string variable A\$. This function can be used to display characters which cannot be entered from the keyboard as follows. PRINT CHR\$ (107) J This displays the graphic character ⊠.	

Note: ASCII code is a standard code system which is frequently used with computers. This code uses 8 bit numbers to represent the letters of the alphabet, numerals, and symbols such as the dollar sign and question mark. The full code set is presented in the table on page 154.

2.5.4 VAL and STR\$

Format	Function	Example
STR\$ (x) x: Numeric expression	Returns a string of ASCII characters representing the value of numeric expression X.	Substitutes the character string 6E +
	n on the screen. Any of up to 8 differen eground (c) or background (b) as shown	leading space to indicate that the plus sign
VAL (x\$) x\$: String expression	Converts an ASCII character repre- sentation of a numeric value into a numeric value. This is the comple- ment of the STR\$ function.	A=VAL ("123") Converts the character string "123" into the number 123 and assigns it to numeric variable A.

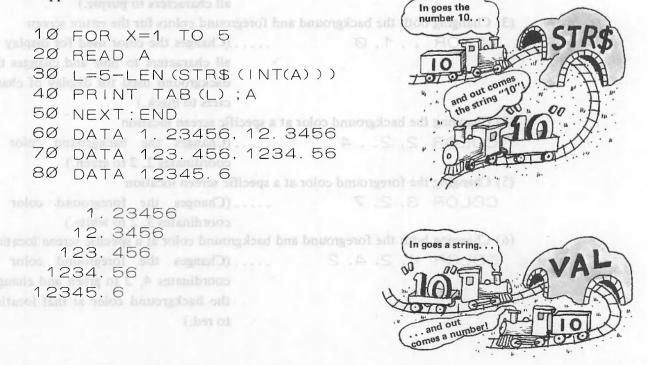

2.6 Color display statement

The following sample program illustrates use of some of the functions discussed above to display numeric values in tabular format (with the decimal points aligned).

1.23456 12.3456 1Ø 1 1234

sing the foreground color of the entire screen (the volor used f

If the values read from DATA statements were displayed using only the PRINT statement, the result would appear as shown below.

2.6

2.6 Color display statement One of the greatest features of the MZ-700 is that it allows characters and graphics to be displayed using any of up to 8 colors.

Format	COLOR X,	y, c <, b >	
	x X co	oordinate (0 to	0 39)
	y Y co	oordinate (0 to	o 24)
	c Cha	racter color sp	pecification (0 to 7).
.2O alt	b Bacl	kground color	specification (0 to 7).
nction			set the foreground and background colors for the character
	thet of shape with		the screen. Any of up to 8 different colors can be specified
	for the cha	racter foregrou	und (c) or background (b) as shown in the table below.
	Color No.	Color	
	0	Black	VAL (x5) Converts an ASCII character repro- x5: String expression sentation of a numeric value into a
		Blue	way mining expression of a manifelic value more a
	- A REAL CONTRACTOR OF A REAL PROVIDED AND A REAL PROVIDA AND A REAL PROVIDED AND A REAL PROVIDA AND A	Red	ment of the STRS function.
	3	Purple	
	4	Green	The following simple program illustrates use of some
	5	Light blue	numeric values in fabular format (with the decimal points
	6	Yellow	
	7	White	1.23456
			12.3456
mple	(1) Changing	ng the backgro	ound color of the entire screen
<u> </u>		R , 2	(Changes the background color used
			for display of characters to red.)
	of all cl	haracters)	ound color of the entire screen (the color used for display
	COLO	R 3	(Changes the color used for display of
			all characters to purple.)
	(3) Changing	ng both the ba	ackground and foreground colors for the entire screen
	COLO	R , , 1, Ø	Control Changes the color used for display of
			all characters to blue and changes the
		TOT	background used for display of chara-
	Anting Ang		cters to black.)
	(4) Changin	ng the backgro	ound color at a specific screen location
	COLO	R 2, 2, ,	4 (Changes the background color at
			coordinates 2, 2 to green.)
	(5) Changin	ng the foregro	und color at a specific screen location
	COLO	R 3, 2, 7	7 (Changes the foreground color at coordinates 3, 2 to white.)
	(6) Changi	ng both the fo	preground and background color at a specific screen location
		R 4, 2, 4	A A A A A A A A A A A A A A A A A A A
	1 John March	ap	coordinates 4, 2 to green and changes
			, 29-0
		A REAL PROPERTY	the background color at that location
		OTCO .	the background color at that location to red.)

2.6.2 Adding color specifications to the PRINT statement

Format	PRINT	[f, b]	variable	<(;)	variable	(;)>
	l ? I		constant	1,1	constant	1,1
			expression		expression	
	or		and the main			

PRINT [f, b] USING "format string"; variable $\langle ; \rangle$ variable>

f Foreground (character color) specification (a number from 0 to 7)

b.... Background color specification (a number from 0 to 7)

Function

Adding the color specifications to the PRINT and PRINT USING statements described on pages 37 and 38 makes it possible to display characters in a variety of colors. In the format above, f indicates the character foreground color, and b indicates the character background color. If only the foreground color is specified, the current background color is used for display of characters; this is done by specifying the foreground color, followed by a comma.

If only the background color is specified, the current foreground color is used for display of characters; in this case, a comma must precede the background color specification.

Example

(Example 1)

PRINT (6, 5) "ABCDE" Displays the letters "ABCDE" in yellow against a background of light (5) There are four per colors file, sld be, green, and red PRINT (, 4) "FGHIJ" Displays the letters "FGHIJ" in yellow against a background of green. PRINT (7,) "VWXYZ" Displays the letter "VWXYZ" in green against a background of white. (Example 2) Let's try adding color to the automobile race program shown on page letters, symbols, or graphic characters can be output while the 1.44 ter is in this mode 10 PRINT (, 1) " 🖸 " $2\emptyset$ Q=INT (5*RND (1)) +2:X=33*RND (1) 30 FOR A=1 TO 5 4Ø READ M\$ 5Ø PRINT TAB (Ø); "♦"; TAB (X); 60 PRINT (Q. 1) M\$; 7Ø PRINT (7, 1) TAB (37); "♦" 80 NEXT A $9\emptyset$ Y=1 \emptyset *RND(1) 100 FOR A=1 TO Y TAB (Ø) 110 PRINT 12Ø TAB (37); "♦": NEXT PRINT 13Ø RESTORE: GOTO 2Ø 14Ø DATA " ZON 15Ø DATA " " • * * * * • * • * *** 16Ø DATA "

> With ordinary PRINT statements (those without color specifications), the foreground and background colors used for character display are those which have been specified with the latest COLOR statement.

2.7 Color Plotter-Printer Commands

The color plotter-printer commands described below can be used with the MZ-731 or, when the MZ1P01 color-plotter printer is connected, with the MZ-711, or MZ-721. The color plotter-printer can be used in either of two modes: The text mode (for printout of program lists, results of calculations, or other character data), or the graphic mode (for drawing figures and graphs).

Further, any of four colors (black, blue, green, or red) can be used for printout of characters and graphics. This capability is particularly useful when using the printer in the graphic mode.

2.7.1 General information about the color plotter-printer

- (1) The color plotter-printer operates in either of two modes: The text mode (for printout of the results of calculations, program lists, and other character data) and the graphic mode (used for drawing figures and graphs). The printer will only operate in one mode at a time. (Graphic printer commands are ignored while the printer is in the text mode, and vice versa.)
- (2) Printer parameters are reset when the printer is switched from the graphics mode to the text mode. (In other words, the pens' X and Y coordinate settings are reinitialized.)
- (3) The printer runs on power supplied from the main unit of the MZ-700, and is not equipped with a separate power switch.
- (4) The following switches are used to control operation of the printer.
 - a. Feed switch Advances the paper.
 - b. Reset switch Resets (reinitializes) the printer.
- c. Pen change switch Used when replacing the printer's pens.
- (5) There are four pen colors: Black, blue, green, and red.
- (6) When the printer is used in the text mode, any of three different sizes of characters can be printed. The largest size permits a maximum of 26 characters to be printed on one line, medium size permits a maximum of 40 characters to be printed on one line, and the smallest size allows up to 80 characters to be printed on one line.
 - Characters which can be printed when using the printer in the text mode are as shown below. No other letters, symbols, or graphic characters can be output while the printer is in this mode.

In most cases, hexadecimal ASCII codes will be printed in a different color if an attempt is made to print graphic characters with the PRINT/-P statement or LIST/P command.

 $\begin{array}{l} \P & \# \$ z \& `() & \# \$ z \& () & \# \$ z \& () & 1 \\ \mbox{IJKLMNOPQRSTUVWXYZ[N] \uparrow \leftarrow e ` ~ t \mbox{IPCq} \\ \mbox{azwsu} & Ok f \lor UBjn Um' > \mbox{olAdd} y & T_{\Box} \rightarrow DB \\ \hline \mbox{DBBD} & \Re \downarrow_{\Box} \P & \# \$ z \& `() & \# , - , 20123456789 & ; <= > ?@A \\ \mbox{BCDEFGHIJKLMNOPQRSTUVWXYZ[N] \uparrow \leftarrow e ` ~ t \mbox{gh} \\ \mbox{bxdrpcqazwsu} & Ok f \lor UBjn Um' > \mbox{olAdd} y & T_{\Box} \rightarrow DB \\ \mbox{BDBD} & \square & \square & \square & \square \\ \mbox{IJKLMNOPQRSTUVWXYZ[N] \uparrow \leftarrow e ` ~ t \mbox{gh} \\ \mbox{Imbox{gh} v = } & \Pi & \square & \square \\ \mbox{IDBD} & \square & \square & \square & \square \\ \mbox{IDBD} & \square & \square & \square & \square \\ \mbox{Imbox{gh} v = } & \Pi & \# & \$ z \& `() & \$ + , - , 20123456789 & ; \\ \mbox{x} & $: $ <= > \\ \end{array}$

2.7.2 Initial Printer Settings

The initial printer settings made when the BASIC interpreter 1Z-013B is started up are as follows.

- (1) Pen color: Black
- (2) Pen position: Left side of the carriage. (top line of 1 page.)
- (3) Mode: Text mode

with oromany **FRINT** statements (those without color specifications), the foreground and background colors used for character display are those which have been specified with the latest COLOR statement.

2.7.3 Mode Specification Commands

These commands are used to place the printer in the text mode for printout of letters and numerics. This is the mode which is effective when the power is turned on; the initial character size is 40 characters/line.

(1) MODE TN (abbreviated format: M. TN)

This command returns the printer to the text mode from the graphic mode and sets the character size to 40 characters/line.

to 80 characters/line.

*** CHARACTER MODE *** 80 character mode ABCDEFGHIJKLMNOPORSTUUWXYZ 40 character mode ABCDEFGHIJKLMNOPORSTUUWXYZ

26 character mode

ABCDEFGHIJKLMNOPQRSTUVWXYZ

The MODE GR command is used to switch the printer from the text mode to the graphics mode for printout of charts and graphs. When switching to this mode, it is necessary for the BASIC program being executed to make a note of the character size being used immediately before the mode change is made. The reason for this is in order to return to the text mode when the BREAK key is pressed or a STOP command is encountered.

Note: Executing MODE command, every state returns to initial state excluding pen color and print size.

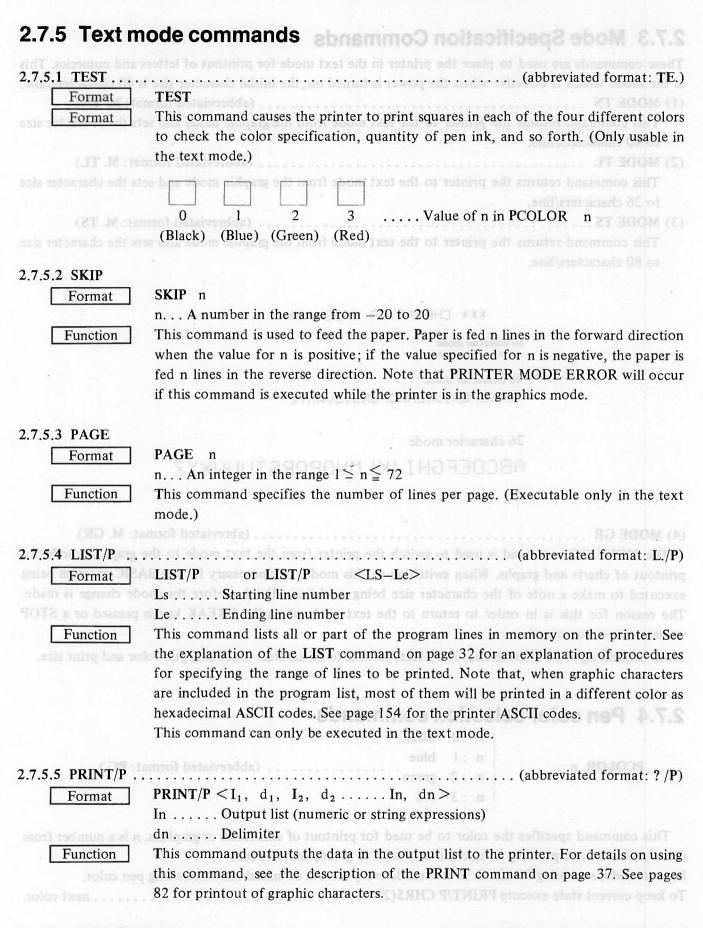

2.7.4 Pen color selection commands

PCOLOR n

n :1	blue green (abbre	eviated format:	PC.)
	-		
	red		
	Output list (numeric or string expre		

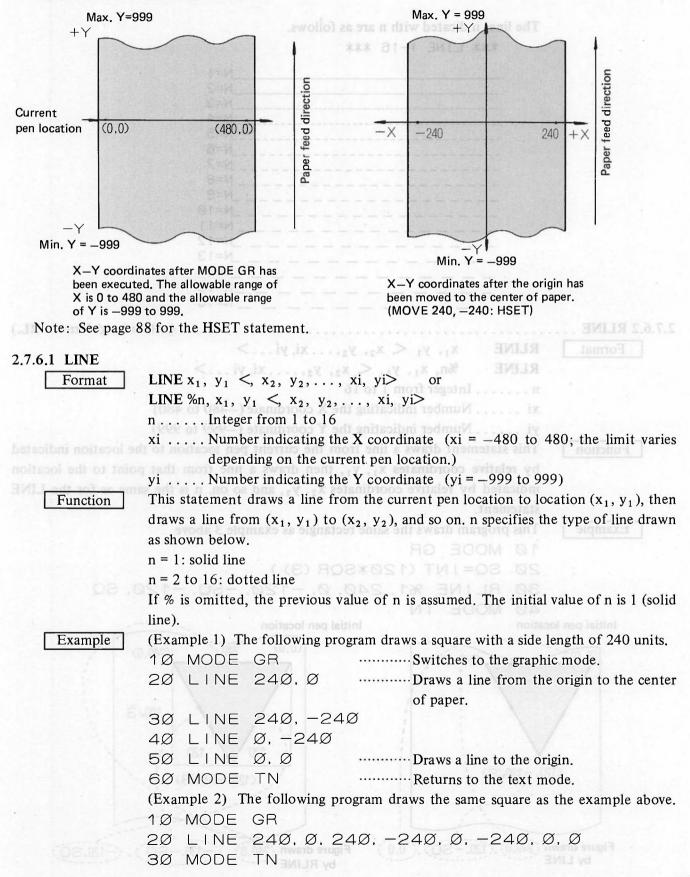

This command specifies the color to be used for printout of characters or graphics. n is a number from 0 to 3, with 0 corresponding to black, 1 to blue, 2 to green, and 3 to red. In text mode, executing PCOLOR in text mode every state is on initial state excluding pen color. To keep current state execute PRINT/P CHR\$(29) next color.

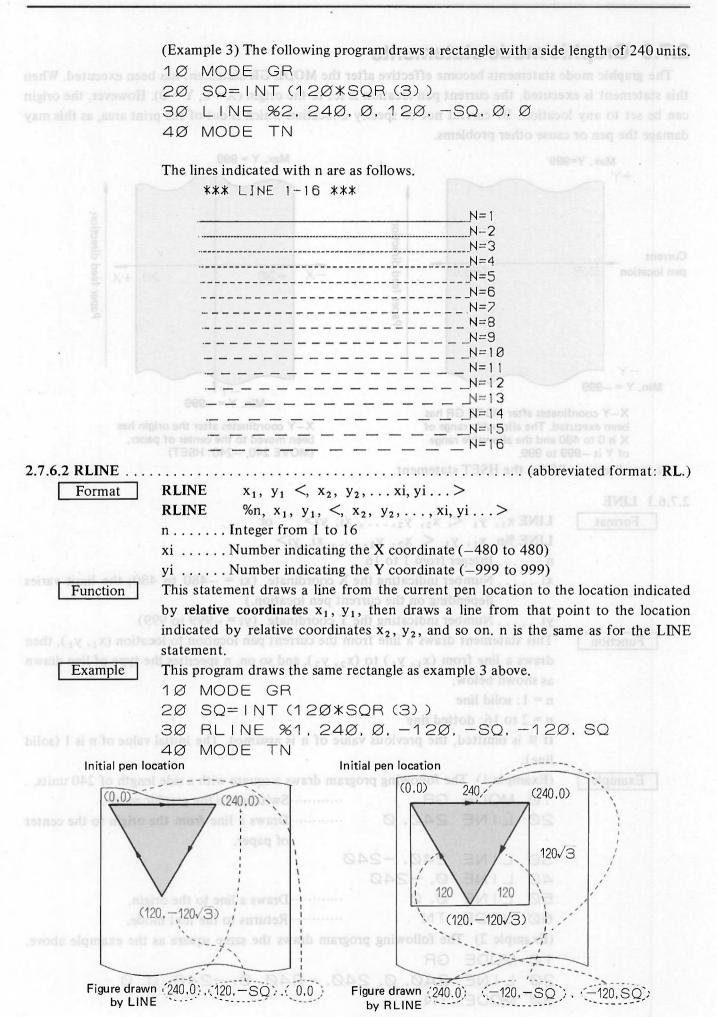

This command can be entered in either the text mode or graphics mode.

2.7.6 Graphic mode statements

The graphic mode statements become effective after the MODE GR statement has been executed. When this statement is executed, the current pen location is set to the origin (X = 0, Y = 0). However, the origin can be set to any location. Be careful not to specify a location which is out of the print area, as this may damage the pen or cause other problems.

	.7.6.6 HSET
Format	MOVE x, y
	x Integer indicating the X coordinate (-480 to 480)
r drawing figures.	y Integer indicating the Y coordinate $(-999 \text{ to } 999)$
Function	This statement lifts the pen and moves it to the specified location (x, y) .
Example	The following program draws a cross with a side length of 480 units.
	10 MODE GR QAS- DAS EVON OS
	20 LINE 480,0
	30 MOVE 240 , 240 Lifts the pen at (480, 0) and moves it t
	12 40 - Store 1
	40 LINE 240, -240 3MOH9 00
	50 MODE TN TXBU OK
	Be sure to advance the paper before executing this program.
	(abbreviated formed: RM.)
Format	RMOVE x, y 2x, [9, n] THING
	x Integer indicating relative X coordinate $(-480 \text{ to } 480)$
	y Integer indicating relative Y coordinate $(-999 \text{ to } 999)$
Function	This statement lifts the pen and moves it to the location indicated by relative
	coordinates $(\Delta x, \Delta y)$ (2 ~ 0 = 9)
Example	The following program draws the same cross as the example for the MOVE stat
	Function This statement prints the specified character using the .insmiss
	1Ø MODE GR dides do being so as as as as as as a second of the second se
	20 LINE 480, 0 Const = a noder solid data no
	$3\emptyset$ RMOVE $-24\emptyset$, $24\emptyset$ Lifts the pen at (480, 0), then moves
	-240 units in the X direction and 24
	units in the Y direction.
	$4\emptyset$ LINE 24 \emptyset , $-24\emptyset$
	50 MODE TN
765 DUOME	Be sure to advance the paper before executing this program.
	PHONE (abbreviated format: PH
Format	PHOME This statement actions the use to the use it.
Function	This statement returns the pen to the origin.
Example	The following example draws the same cross in red as the example for the MOV statement.
	1Ø MODE GR
	$\gamma_{1}(A + 1) = 1 \otimes (A + (A$
	20 LINE 480,0 :MOVE 240,240
	30 LINE 240, -240
	3ØLINE24Ø, -24Ø4ØPHOME
	3Ø LINE 24Ø, -24Ø4Ø PHOME5Ø PCOLOR 3
	3Ø LINE 24Ø, -24Ø 4Ø PHOME
	3Ø LINE 24Ø, -24Ø4Ø PHOME5Ø PCOLOR 3

	HSET
Function	This statement sets the current pen location as the new origin. With this feature, the origin can be set to the location which is most appropriate for drawing figures. A MOVE statement is frequently executed before executing this command.
Example	1Ø MODE GR
	20 MOVE 240, -240 90 BOOM 01
	3Ø HSETSets the new origin.
	50 LINE 240*COS (PAI(1)*I/180),240*SIN (PAI(1)*I/180 60 PHOME
	70 NEXT UT BOOM 08
	80 MODE TN and and a second se
67 GPRINT	
Format	GPRINT [n, @], x\$
Format	GPRINT x\$
	n Integer indicating the character size $(0 \sim 63)$
	@ Integer indicating the direction in which lines of characters are printed (@ = 0 ~ 3)
	x\$ Character since out events intragong antwolfor sill
Function	This statement prints the specified character using the specified size and direction
	80 characters can be printed on each line when $n = 0$; 40 characters can be printed
	on each line when $n = 1$; and 26 characters can be printed on each line when $n = 2$
	When n and @ are omitted, the previous settings are assumed. Their initial values ar
	n = 1 and $@ = 0$.

The coordinates can be used in the same manner as ordinary Cartesian coordinates after setting the point of intersection of the X and Y axes as the new origin, (X = -240 to 240)

2.8 Machine Language Program Control Statements

Several machine language program control statements are suported by the MZ-700 BASIC interpreter. With these statements, machine language programs can be linked with a BASIC program.

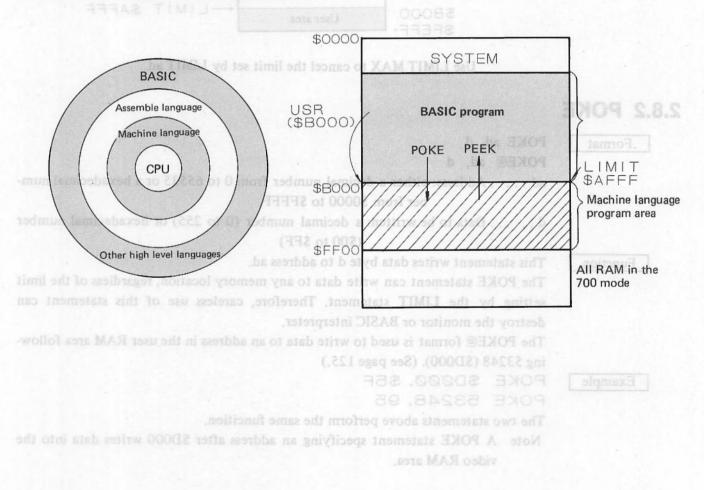

Computer programming languages form a hierarchical structure as shown below. High level languages such as BASIC automatically performs work required when lower level languages such as assembly language are used. Although high level languages are convenient and easy to use, they cannot control the CPU directly.

The lowest level language (machine language) directly controls the CPU and provides high processing speed, but considerable skill is required for coding long programs.

Machine language program control statements enable sophisticated programming techiques which make it possible to utilize the advantages of both BASIC and machine language.

Machine language programs can be generated and loaded into the machine language program area (reserved with the BASIC LIMIT statement) using the monitor or assembler and loader. Such machine language programs can be called by BASIC programs with the USR () function. Machine language programs can also be loaded into memory using a BASIC program which uses the POKE statement to write each step in machine code. The resultant machine language program can then be called by BASIC programs with the USR () function.

The memory map at bottom right outlines the concept of data access with POKE and PEEK, and of calling machine language programs with USR ().

2.8.1	LIMIT
F	ormat

Function

Example

LIMIT ad

ad Address; either a decimal number from 0 to 65279 or a 4-digit hexadecimal number from \$0000 to \$FEFF.

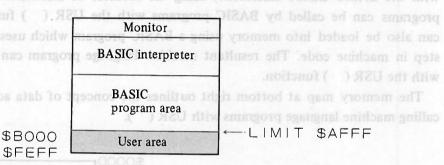

This statement limits the memory area which can be used by the BASIC interpreter. ad indicates the upper limit of the BASIC area, and the area from the following address (ad + 1) to \$FEFF (65279) can be used for machine language programs or special data.

LIMIT \$AFFF

Limits the BASIC program area to \$AFFF.

Note The area from \$FF00 to \$FFFF is used by the monitor as a work area, so it cannot be used as the user area. The LIMIT statement must be used at the beginning of a BASIC program.

-LIMIT SAFFF

Use LIMIT MAX to cancel the limit set by LIMIT ad.

2.8.2 POKE						
Format	POKE ad, d					
TIMIL	POKE@ ad, d					
	ad Address: either a decimal number from 0 to 65535 or a hexadecimal num-					
ber from \$0000 to \$FFFF.						
	d Data to be written: a decimal number (0 to 255) or hexadecimal number (\$00 to \$FF)					
Function	This statement writes data byte d to address ad.					
700 mode	The POKE statement can write data to any memory location, regardless of the limit setting by the LIMIT statement. Therefore, careless use of this statement can					
	destroy the monitor or BASIC interpreter.					
	The POKE@ format is used to write data to an address in the user RAM area follow-					
	ing 53248 (\$D000). (See page 125.)					
Example	POKE \$DØØØ, \$5F					
	POKE 53248,95					
	The two statements above perform the same funcition.					
	Note A POKE statement specifying an address after \$D000 writes data into the					
	video PAM area					

video RAM area.

2.8.3 PEEK	2.8.5 Preparing machine language programs
Format	PEEK (ad) means velgeb endre offelin double menore several endoem A
	PEEK@ (ad)
ji.	ad Address in decimal or hexadecimal notation (0 to 65535 or \$0000 to \$FFFF)
Function	This function returns the contents of the specified address as a decimal number from 0 to 255. Use the PEEK@ format to PEEK a user RAM area following 53248 (\$D000).
Example	The following program displays data stored in the area from 40960 (\$A000) to 40975 (\$A00F).
	TO FOR AD- 40900 TO 40975
	20 Y PEEK (AU)
	30 NEXT AD
	118 DATA 213:SEM 20194 DE
2.8.4 USR	
Format Function	 USR (ad) USR (ad, x\$) ad Address (decimal or 4-digit hexadecimal) x\$ String data This is a special function which transfers control to a machine language program which starts at the specified address. As with CALL ad, so control is returned to the statement following the USR function if the machine language program includes a return instruction (RET or RET_cc). When x\$ is specified, the starting address of the memory area containing x\$ is loaded into the DE register, then the length of x\$ is loaded into the B register before the machine language program is called. This makes it possible for a BASIC program
	to pass string data to a machine language program
	13 1134,102 0100 005
	228 DATA 225:REM POP HL
	290 DATA 193:REM POP BC 300 DATA 201:REM RET Returns to the BASIC program.
	300 DATA 201:REM RET RET Returns to the BASIC program.

If the machine language program has been generated with the monitor and saved on cassette tape under the file name DISPLAYCODE, use the following program to call the machine language program.

> 10 LIMIT \$BFFF 10 LOAD DISPLAYCODE' 20 USR (\$C000)

2.8.5 Preparing machine language programs

A machine language program which fills the entire display screen with the characters supported by the MZ-700 is presented in this section as an example.

The following BASIC program loads such a machine program into memory and calls it.

10 LIMIT \$BFFF Limits the BASIC area to \$BFFF. 20 GOSUB 50 30 USR(\$C000)Calls the machine language program. 40 END and the set of the betote stab available managing aniwold of the 50 FOR I =49152 TO 49181 60 READ M Reads data for the machine language program from DATA 70 POKE I,M statements and writes it into the machine language area. 80 NEXT I 90 RETURN 100 DATA 197:REM PLISH BCBeginning of data for the machine language program. 110 DATA 213:REM PUSH DE 120 DATA 229 : REM PUSH HL 130 DATA 22,0:REM LD D,0 140 DATA 33,0,208:REM LD HL, D000H 150 DATA 1,232,3.REM LD BC, 1000 160 DATA 243:REM or 4-digit hexadecim10 Switches the memory block to video RAM. (See page 170 DATA 211,227:REM OUT (E3H),A 155). 180 DATA 114:REM STO:LD (HL),D INC HLSets a display code to video RAM. 190 DATA 35:REM 200 DATA 20:REM statement following the USR function if Ide ONI hine langu 210 DATA 11:REM DEC BC 220 DATA 120 : REM When x5 is specified, the starting addr8,6,01 230 DATA 177:REM OR C 240 DATA 194, 14, 192 . REM JP NZ, STO OUT (E1H), A Switches the memory block to RAM. (See page 127.) 250 DATA 211,225:REM chine lang ΕI 260 DATA 251 :REM 270 DATA 225 REM POP HL 280 DATA 209 : REM POP DE 290 DATA 193:REM POP BC 300 DATA 201:REM RET Returns to the BASIC program.

If the machine language program has been generated with the monitor and saved on cassette tape under the file name DISPLAYCODE, use the following program to call the machine language program.

11Ø LIMIT \$BFFF 11Ø LOAD "DISPLAYCODE" 12Ø USR (\$CØØØ)

2.9 I/O Statements

All external devices (including floppy disk drives) are connected to the MZ-700 through an optional interface board. The optional universal interface board makes it possible for the user to connect external devices such as an X-Y plotter, paper tape punch, and music synthesizer to the MZ-700.

2.10 Other Statements

A port address selection switch is provided on the universal interface card to allow any port address from 0 to 239 (00H to EFH) can be assigned to any devices. Addresses 240 to 255 are reserved for optional peripheral devices supplied by Sharp.

The INP and OUT statements allow the user to transfer data from/to external devices through the optional universal I/O card. The format of these statements is as follows.

INP #P, D...... Reads 8-bit data from port P, converts it into a decimal number and assigns it to variable D.

OUT #P, D Converts a decimal number in variable D to binary format and outputs it to port D.

These statements greatly extend the range of applications of the MZ-700 series computers.

Destination line number

This statement branches execution to the error processing (trap) routine starting at line Lr or executes the statement following THEN when the result of <relational expression using ERN> is true.

RN is a special function which returns a number corresponding to the type of error ccurring. See page 159 for the error numbers.

he following shows an error processing routine beginning on line 1000 which causes secution to branch to line 1200 if the error number is 5

10 ON ERROR GOTO 1000------Dectares the line number of the error processing routine.

000 IF ERN=5 THEN 1200 Branches to 1200 if a strin overflow error has occurred

2.10 Other Statements

ON ERROR GOTO (Abbreviated format: ON ERR. G.) 2.10.1

Format Function

Lr... Destination line number (entry point of an error processing routine) This statements causes execution to branch to line number Lr if an error occurs. The IF ERN and IF ERL statement can be used in a trap routine starting at that line to control subsequent processing according to the type of error and the line number in which it occurred. Including a RESUME statement at the end of the error processing routine makes it possible to return execution to the line at which the error occurred. Executing an ON ERROR GOTO statement cancels the error trap line number definied by the previous ON ERROR GOTO statement. The error trap line number definition is also cancelled by executing a CLR statement.

ON ERROR GOTO Lr

I/O Statements

2.10.2 IF ERN Format

- IF relational expression using ERN THEN Lr
- IF relational expression using ERN THEN statement
 - IF relational expression using ERN GOTO Lr
 - Lr . . . Destination line number

Function

This statement branches execution to the error processing (trap) routine starting at line Lr or executes the statement following THEN when the result of <relational expression using ERN> is true.

ERN is a special function which returns a number corresponding to the type of error occurring. See page 159 for the error numbers.

Example

The following shows an error processing routine beginning on line 1000 which causes execution to branch to line 1200 if the error number is 5.

10 ON ERROR GOTO 1000...... Declares the line number of the error processing routine.

.....

1000 IF ERN=5 THEN 1200.....Branches to 1200 if a string overflow error has occurred.

0.3 IF ER	2.10.6 PLOT ON
Format	IF relational expression using ERL THEN Lr MOTOLY
	IF relational expression using ERL THEN statement

Format	PLOT ON 1.1 MEHT JAE gnizu noizengas isnoitaist 10 tempol
Function	This statement makes it possible to use the color plotter-printer as a display unit. Thus, the MZ-700 can be used without an external display screen.
	This statement is effective only when the color plotter-printer is installed and the
	MODE TN statement has been previously executed.
Example	PLOT ON
Note	A period "." is printed to represent any characters which are not stored in the color plotter-printer's character generator (see page 156). The <u>INST</u> , <u>DEL</u> and " \leftarrow " keys are disabled by executing this statement. <u>CTRL</u> + <u>G</u> can be used to change the pen.
0.7 PLC	OT OFF
Format	PLOT OFF
Function	This statement cancels PLOT ON made of plotter-printer operation.
Example	PLOT OFF
	2404 00000
.8 COI	NSOLE
Format	CONSOLE $\langle I_s, I_n \langle C_s, C_n \rangle \rangle$
	Is : Starting line of the scroll area
	In · Number of lines within the scroll area
	Cs : Starting column of the scroll area
	C_n : Number of columns in the scroll area I_s
Example	CONSOLE Ø, 25, Ø, 4Ø
<u>.</u>	CONSOLE 5.15
	CONSOLE Ø, 25, 5, 3Ø
	CONSOLE Ø, 1Ø, Ø, 1Ø
	CONSOLE
Function	This statement specifies the size of the scroll area; i. e., the area which is cleared by
	PRINT " C ".
	The first example specifies the entire screen as the scroll area. The second specifies
	the area between lines 5 and 15 as the scroll area. The third specifies the area bet-
	ween columns 5 and 30 as the scroll area. The fourth specifies the 10×10 positions
	at the upper left corner of the screen as the scroll area.
	This statement is useful for excluding the left and/or right edges of the image from
	the display area. When they are hidden behind the edges of the screen.
	The last example does not specify the scroll area. When the scroll area is not speci-
	fied, it is possible to scroll the screen up or down.
	However, this makes it harder to perform screen editing because the values of Cn

However, this makes it harder to perform screen editing because the values of Cn and In become smaller.

2.11 Monitor Function became the moment with S

The IOCS section of the BASIC Interpreter includes a monitor program to make it easy to enter machine language programs. This monitor program uses the area from FF00H to FFFFH as a stack area.

This monitor program includes the screen editor similar to that of BASIC which makes it possible to change the contents of any address within the 64K RAM area as described below.

2.11.1 Editing format

address =	data	data	data
: (colon)		Indicates	s that the line following can be edited.
address		Indicates	s the starting address of the memory area whose contents can be changed.
		(4 hexad	lecimal digits)
=		Separates	s data from the address.
data		2-digit h	exadecimal number or a semicolon ";" plus the character which is written in
		the speci	ified address. A blank is used to separate adjacent data items.
			the end address. When found, the address of the string and its contents are i

2.11.2 Printer switching command (P command) Format * P

This command switches data output with the D or F command between the printer and display. If the printer is not connected to the computer, the message "ERR?" is displayed and the monitor stands by for input of another command. Check the printer connection or execute the P command again to switch the output device to the display.

Format * D < start address < _ end address >>

This command dumps the contents of memory from the starting address to the end address. If the end address is omitted, the contents of the 128-byte block starting at the specified address are dumped. If both addresses are omitted, it dumps the contents of the 128-byte block following memory block previously dumped. The format in which data is dumped is as follows.

						ave command	
:НННН=НН_Н	н_нн н	нн	НН	НН	ΗН	ZABCDE. G.	
1	1731 . Longhan		MILLIN	nor a north of			
Starting adress	8 bytes (1	Hexade	cimal c	code)		8 bytes (Characters)	

The contents of any location can be changed by moving the cursor to the corresponding byte, entering the new data, and pressing the $\overline{|CR|}$ key.

Note Control codes are displayed as a period (.) in the character data field. Pressing the <u>BREAK</u> key stops dump output, and pressing the <u>SHIFT</u> and <u>BREAK</u> keys simultaneously returns the monitor to the command input mode.

Format * M [starting address]

machine language programs. This monitor program uses the area from FF00H to FFFFH as a stack area. This command is used to change the contents of memory. If the starting address is omitted, the address currently indicated by the program counter is assumed. Press the SHIFT and BREAK keys together to terminate this command.

When this command is entered, the starting address of the memory block and its contents are dispalyed in the editing format described previously and the cursor is moved to the data to be changed. Enter the new data and press the $\overline{|CR|}$ key; the following address and its contents are then displayed.

Fin command (F command) 2.11.5

* F [starting adress] [end adress] [data] [data] Format

This command searches for the specified data string in the memory area from the starting address to the end address. When found, the address of the string and its contents are dumped to the screen. This command is terminated by simultaneously pressing the SHIFT and BREAK keys.

Subroutine call (G command) 2.11.6

Format *** G [call address]**

This command calls the subroutine starting at the specified address. The stack pointer is located at FFEEH.

2.11.7

* T [starting address] [end address] [destination adress] Format

This address transfers the contents of memory between the starting address and the end address to the memory area starting at the destination address.

2118	Save command	(S command)
E.I.I.V	ouro commana	(e communa)

Format

* S[starting address] [end adress] [execution adress] : [file name]

This command saves the contents of the memory between the starting address and the end address to cassette tape under the specified file name.

2.11.9 Load command (L command)

Format * L < load address > < : file name >

This command loads the specified file into memory, starting at the load address. If the load address is omitted, the execution address contained in the file is assumed as the load address. If the file name is omitted, the first file encountered on the tape is loaded. The message "ERR?" is displayed if a check sum error is detected or the <u>BREAK</u> key is pressed during execution, then the monitor returns to the command wait state input mode. The command input mode wait state is entered when execution is wait state is entered when execution is completed.

Format **X** V < file name >

This command reads the specified file from cassette tape and compares it with the contents of memory. This makes it possible to confirm that a program has been properly recorded with the SAVE command. If any difference is found between data read from the tape and that contained in memory, the message "Err?" is displayed.

This command returns control to the system program which called the monitor program and restores the SP (stack pointer) and HL register to the values which they contained when the monitor program was called. Execution resumes with the command following BYE is executed.

This command cannot return control if the monitor has been called by a system program whose stack pointer is between FF00H to FFFFH, or if the stack pointer does not contain a return address. In such cases, use the G command to call the warm start entry point.

211.9 Load command (L command)

* L < ioad address > <: file name >

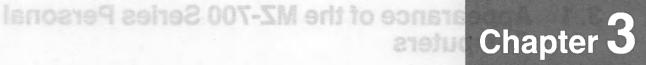

error is directed or the COREAN Rev is pressed during execution. Sean anomator esturing to the

it any difference is found between data read from the true and that contained in memory, the

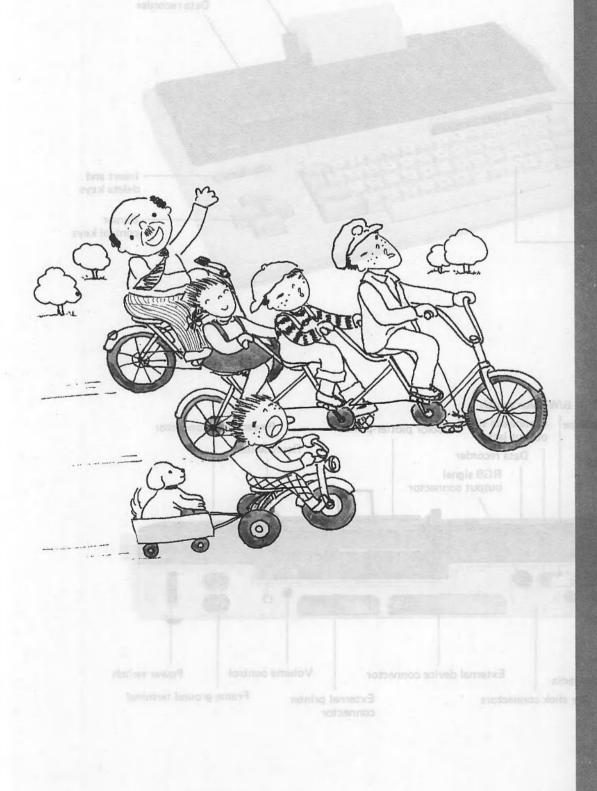

and reforment returns a second to the system program which colled the monitor program and restores

Return command

pointer is between FF00H to FFFFH, or if the stack pointer does not contain a return address. In such cases, use the G command to call the warm start entry point.

3.2 Connection to Display Unit

Be sure to turn off both the computer and display unit before connecting them.

3.2.1 Connecting a TV set to the MZ-700

Disconnect the antenna feeder from the UHF antenna terminals of the TV set. Plug the connection cable provided into the RF signal output jack on the rear panel of the computer and connect the pin plugs on the cable's other end to the 75-ohm UHF antenna terminals on the TV set.

Back view of MZ-700

Back view of Home TV

Front view

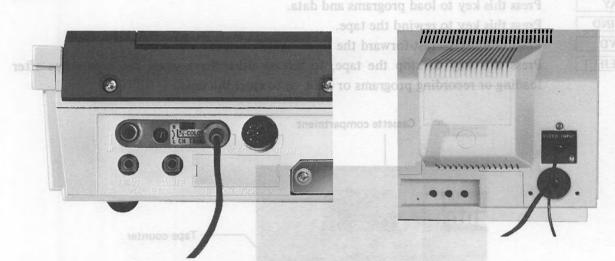

Set the channel selection switch to the 36 ± 3 ch position, depending on which is not used in your area.

Note the following when using an ordinary TV set as a display unit.

- Adjust controls (fine tuning, color control, etc.) of the TV set to optimum conditions before connecting it to the computer.
- Note that color and quality of displayed images will be poorer with a TV set than when a special color monitor unit is used. Further, note that images may be painted with the wrong colors or may not be colored if the TV set is not properly adjusted.
- Part of the screen may be omitted if vertical and horizontal scanning frequencies of the TV set do not match those of the computer. This is not a problem with the computer; contact your TV dealer.
- Part of the screen may not be visible if the image is not centered.
- Be sure to remove the antenna feeder from the TV set before connecting it to the computer; otherwise, the signal from the computer will radiate from the TV antenna, possibly interfering with other TV sets.
- Be sure to connect the computer to the 75-ohm antenna terminals of the TV set. If the cable provided cannot be used, be sure to use a 75-ohm coaxial cable.
- Characters may be hard to read with certain combinations of foreground and background colors. In such cases, switch the B/W-color switch to the B/W position to obtain higher contrast. The best combination of the foreground and background colors is white for the foreground and black or blue for the background.
- No audio signal is included in the RF signal fed to the TV set, so sound cannot be output from the speaker of the TV set.

3.2.2 Connecting the MZ-1D04 12-inch green display to the computer

Use the cable included with the MZ-1D04 green display to connect it to the computer. Plug the cable into the composite signal jack on the computer's rear panel, then set the B/W-COLOR switch to the B/W position.

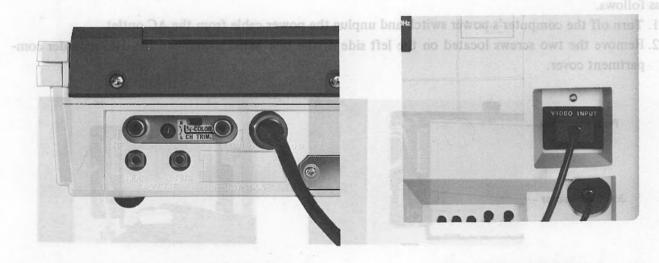

Rear panel of the MZ-700 series computer

Rear panel of the MZ-1D04

3.2.3 Connecting the MZ-1D05 14-inch color display to the computer

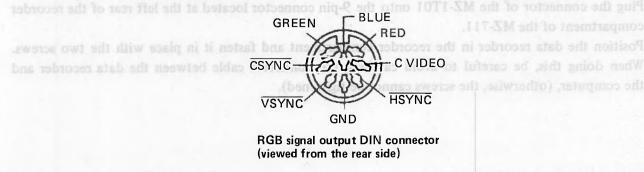

Use the cable included with the MZ-1D05 color display to connect it to the computer. Plug the cable's DIN connector into the RGB signal output connector on the MZ-700.

Rear panel of the MZ-700 series computer

Rear panel of the MZ-1D05

Pin assignments of the RGB signal output connector of the MZ-700 are as shown below.

Data Recorder 12 doni-St 4001-SM edit politoenne0 S.S.E 3.3

Data recorder built into the MZ-731 and MZ-721

The built-in data recorder can be operated in the same manner as an ordinary cassette tape recorder.

	RECORD
	PLAY
	REWIND
	FFWD
S	TOP/EJECT

- Press this key to record programs and data.
- Press this key to load programs and data.

Press this key to rewind the tape.

Press this key to fast-forward the tape.

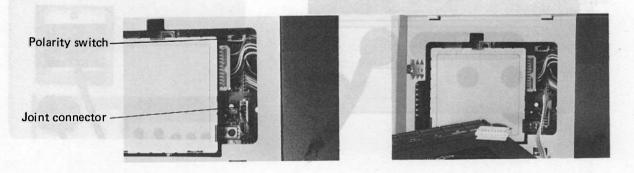

Press this key to stop the tape, to release other keys when the tape stops after loading or recording programs or data, or to eject the tape.

■ MZ-1T01

The MZ-1T01 data recorder unit can be installed in the MZ-711 (MZ-710). Installation procedures are as follows.

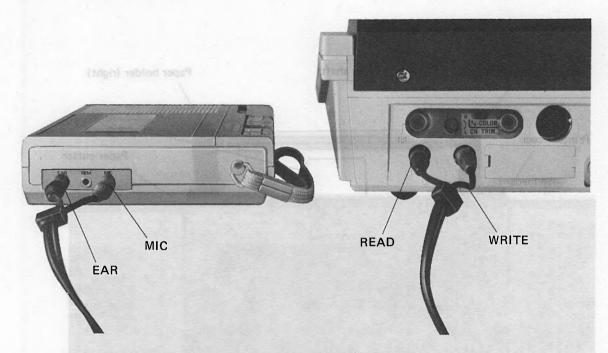

- 1. Turn off the computer's power switch and unplug the power cable from the AC outlet.
- 2. Remove the two screws located on the left side of the rear panel to remove the data recorder compartment cover.

- 3. Remove the joint connector cover.
- 4. Plug the connector of the MZ-1T01 onto the 9-pin connector located at the left rear of the recorder compartment of the MZ-711.
- 5. Position the data recorder in the recorder compartment and fasten it in place with the two screws. When doing this, be careful to avoid catching the connector cable between the data recorder and the computer, (otherwise, the screws cannot be tightened).

Ordinary cassette tape recorder

3.4 Color Plotter-Printer

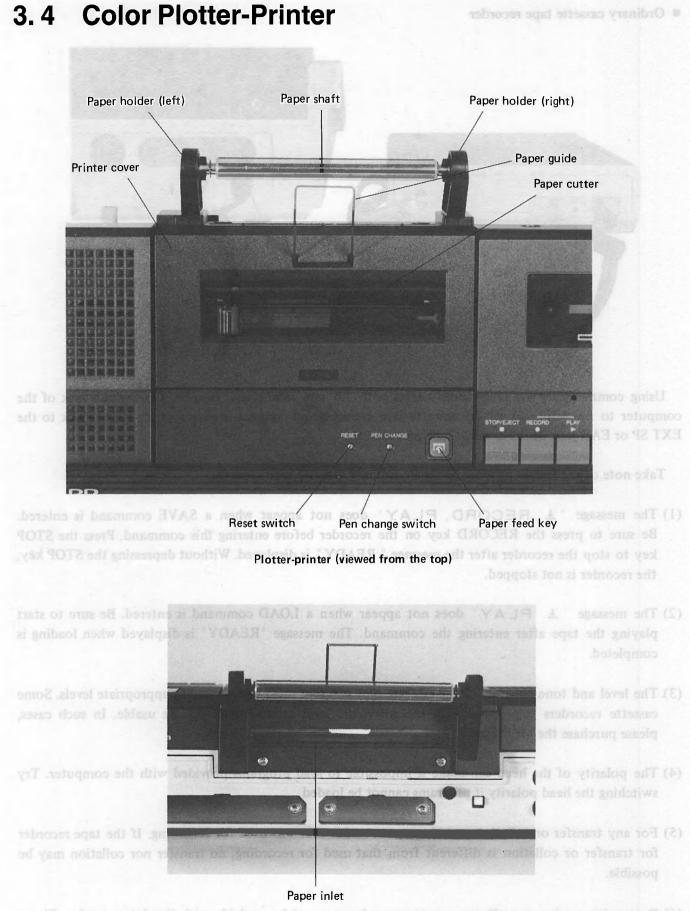

Using commercially available audio cables with 3.5 mm mini-plugs, connect the WRITE jack of the computer to the MIC jack of the cassette tape recorder and connect the computer's READ jack to the EXT SP or EAR jack of the cassette tape recorder.

Take note of the following when using an ordinary cassette tape recorder.

- (1) The message " L RECORD. PLAY " does not appear when a SAVE command is entered. Be sure to press the RECORD key on the recorder before entering this command. Press the STOP key to stop the recorder after the message " READY " is displayed. Without depressing the STOP key, the recorder is not stopped.
- (2) The message " ± PLAY " does not appear when a LOAD command is entered. Be sure to start playing the tape after entering the command. The message "READY" is displayed when loading is completed.
- (3) The level and tone controls of the cassette tape reocrder must be adjusted to appropriate levels. Some cassette recorders (e.g. those with the automatic level control) may not be usable. In such cases, please purchase the MZ-1T01.
- (4) The polarity of the head can make it impossible to load programs provided with the computer. Try switching the head polarity if programs cannot be loaded.
- (5) For any transfer or collation, use the tape recorder that was used for recording. If the tape recorder for transfer or collation is different from that used for recording, no transfer nor collation may be possible.

aper inlet

(6) Data written using an ordinary cassette recorder may not be readable with the data recorder. Therefore, use of the MZ-1T01 is recommended.

Plotter-printer (viewed from the rear side)

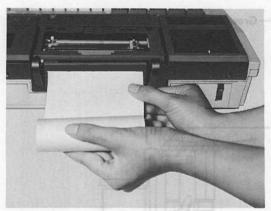

Loading roll paper

1. Remove the printer cover.

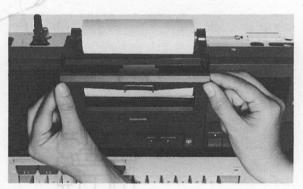

- 2. Cut the end of roll paper straight across and insert the end into the paper inlet. (Be careful to avoid folding or wrinkling the end of the paper when doing this.)
- 3. Turn on MZ-731's power switch and press the + (paper feed) key to feed paper until the top of paper is 3 to 5 cm above the outlet.
 - 4. Insert the paper shaft into the roll and mount it to the paper holders.
 - 5. Set the printer cover so that the end of paper comes out through the paper cutter.
 - To remove the roll from the printer for replacement, cut straight across the paper at the paper inlet and press the paper feed key.
- Roll paper for the MZ-700 series computers is available at any Sharp dealer. Do not use paper other than that specified.

The length of the paper is 23 to 25 meters, and the maximum roll diameter which can be loaded is 50 mm. Paper will not feed properly if a roll with a greater diameter is used, resulting in poor print quality.

Procedures for loading roll paper

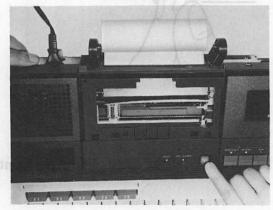

(A) Insert paper into the paper inlet.

a Installing/replacing pens

(C) Replace the printer cover.

- (B) Press the paper feed key to feed paper.
- Replacements for the printer pens (ballpoint pens) can was purchased.
 - · EA-850B (black; 4 pens)
- · EA-850C (black, blue, green, red; 4 pens, 1 of each color)

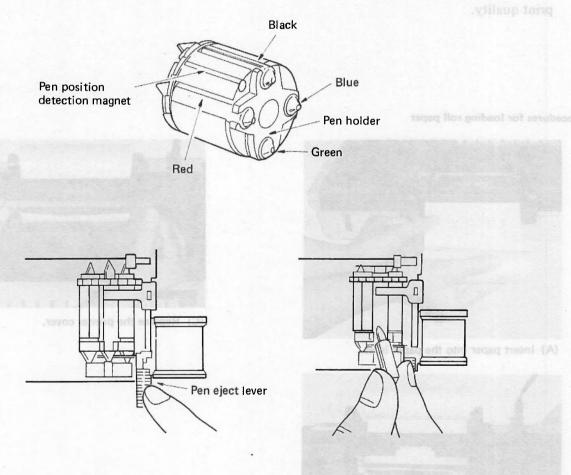

Installing/replacing pens

Loading roll paper
 Remove the printer row

- 1. Remove the printer cover and press the PEN CHANGE switch with a ball pen or the like; this causes the pen holder to move to the right side of the printer for pen replacement.
- 2. Depress the pen eject lever to eject the pen which is at the top of the holder. When doing this, rest your finger lightly on top of the pen while pushing the eject lever to prevent it from falling inside the printer.
 - 3. Insert a new pen. We rear all depend the zeroe range to be add tell or two rearing all tall?
 - 4. Press the PEN CHANGE switch again to bring another pen to the top of the holder.
 - 5. Replace all four pens (black, blue, green and red) in the same manner. When finished, press the RESET switch to ready the printer for printing with the black pen. Execute the BASIC TEST command to confirm that all colors are printed correctly.

Roll paper for the MZ-700 series computers is available at any Sharp dealer. Bo not use paper other

The length of the paper is 23 to 25 meters, and the maximum roll diameter which can be loaded is 50 mm. Paper will not feed properly if a roll with a greater diameter is used, resulting in poor

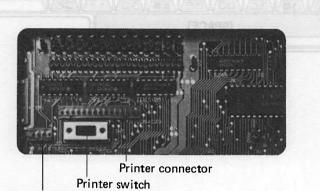

- Replacements for the printer pens (ballpoint pens) can be purchased at the dealer where the printer was purchased.
 - EA-850B (black; 4 pens)
 - EA-850C (black, blue, green, red; 4 pens, 1 of each color)

■ MZ-1P01

3.5 Key Operation

Installation of the MZ-1P01 color plotter printer (for models other than the MZ-731)

- 1. Turn off the computer's power switch and unplug the power cable.
- 2. Remove the two screws located at the center of the rear panel to remove the printer compartment cover.
- 3. Confirm that the printer switch on the printed circuit board is set to the INT position.
- 4. Plug the printer connector into the matching connector on the printed circuit board, then position the printer in the printer compartment and fasten it in place with the two screws. When doing this, be careful to avoid catching the connector cable between the data recorder and the computer (otherwise, the screws cannot be tightened).

Power connector

ternal printer ---- INT (color plotter-printer)

3.5.1 Typewriter keyboard

Connection of color plotter-printer to the MZ-700

Connecting an external printer (MZ-80P5(K))

The MZ-80P5(K) printer for the MZ-80K series computers can be connected to the MZ-700's external printer connector (see page 104) without any special interface card. Use an optional connection cable for making the connection.

When using an external printer, the printer switch on the printed circuit board must be set to the external printer position. Therefore, the color plotter-printer and the external printer cannot be used simultaneously.

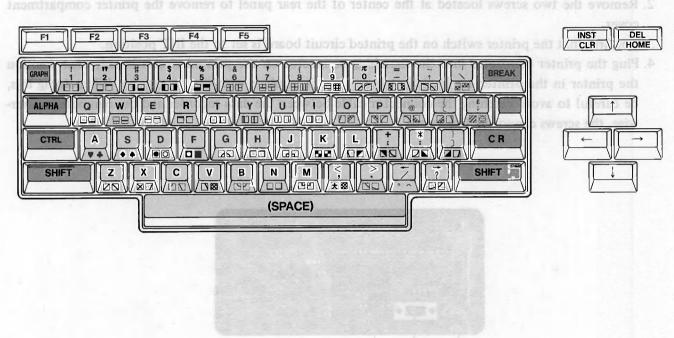

Note that if a program including color plotter-printer control statements is run with an external printer, meaningless characters (control codes for the plotter-printer) will be printed.

3.5 Key Operation

MZ-1P01

Connecting an external printer (M

Instaliation of the MZ-1P01 color plotter printer (for models other than the MZ-731) 1. Turn off the computer's power switch and unplug the power cable.

3.5.1 Typewriter keyboard

Except for the special control keys, several characters are assigned to each key on the keyboard. The character entered when a key is pressed depends on the input mode selected by the special keys.

The input modes are as follows.

(1) Normal mode This mode is automatically entered when the BASIC interpreter is loaded. In this mode, the ASCII character (uppercase or lowercase) shown on top of each key is entered when that key is pressed.

(2) Graphic mode This mode is entered when the <u>GRAPH</u> key is pressed. In this mode, the graphic pattern shown on the left front of each key is entered when that key is pressed. The graphic pattern shown on the right front of each key is entered by pressing that key together with the shift key. Pressing the <u>ALPHA</u> key returns input to the normal mode.

Pressing the space bar enters a space regardless of the input mode.

The MZ-80P5(K) printer for the MZ-80K series computers can be connected to the MZ-700's external printer connector (see page 104) without any special interface card. Use an optional connection cable for making the connection.

When using an external printer, the printer switch on the printed circuit board must be set to the external printer position. Therefore, the color plotter-printer and the external printer cannot be used simultaneously.

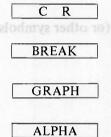

Note that if a program including color plotter-printer control statements is run with an external printer, meaningless characters (control codes for the plotter-printer) will be printed.

	indicated by the screened	y each key in the normal mode are as	
	opercase C wercase c		
AND UL RUS			
		Graphic mode 🛛	

The special keys are explained below.

Pressing this key allows shift position characters to be entered.

For alphabetic keys, the shift position characters are lowercase letters; for keys other than alphabetic keys, the shift position characters are those shown on the upper side of the key tops. In the GRAPH mode, the graphic pattern shown on the right front of each key is entered.

SHIFT

the cursor to the beginning of the next line. Pressing this key enters a BREAK code. Pressing it together with the <u>SHIFT</u> key stops execution of a program or operation of the data recorder.

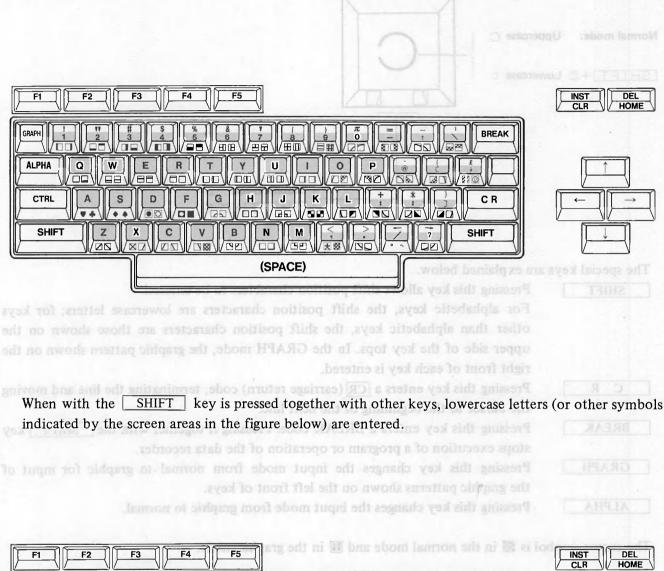

Pressing this key enters a $|\overline{CR}|$ (carriage return) code, terminating the line and moving

Pressing this key changes the input mode from normal to graphic for input of the graphic patterns shown on the left front of keys.

Pressing this key changes the input mode from graphic to normal.

The cursor symbol is 🕱 in the normal mode and 🗈 in the graphic mode.

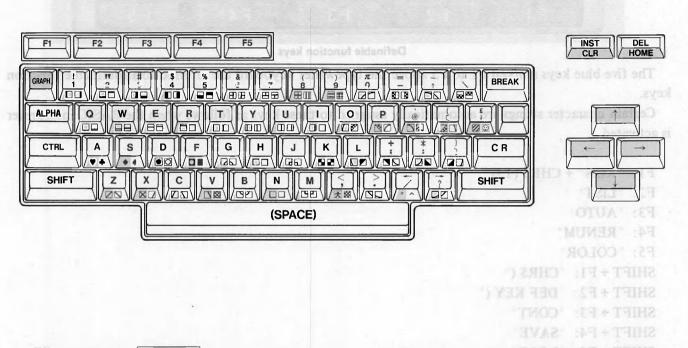

(1) Normal mode (alphanumeric mode) Character entered by each key in the normal mode are as indicated by the screened areas in the figure below.

	CLR DEL HOME
$ \begin{array}{ c c c c c c c c c c c c c c c c c c c$	
SHIFT Z X C V B N M ; SHIFT	
(SPACE)	

116-

(2) Graphic mode

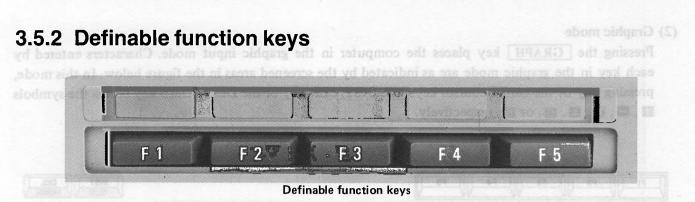

When with the SHIFT key is pressed together with other keys, symbols indicated by the screen areas in the figure below are entered.

When one of these keys is pressed, the character string assigned to that key is entered; thus, statements which are frequently used can be entered just by pressing one key. The character string assigned to any of the definable function keys can be changed by the DEF KEY statement. (See page 57, DEF KEY statement.)

	Definable luncho
$\begin{array}{c c c c c c c c c c c c c c c c c c c $	

The cursor symbol is 🖩 in the graphic mode. To return the mode to normal, press the ALPHA key.

The five blue keys marked F1 to F5 above the typewriter keyboard are referred to as definable function keys.

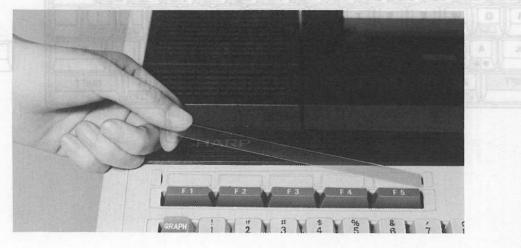

Certain character strings are automatically assigned to these keys as follows when the BASIC interpreter is activated.

F1: "RUN" + CHR\$ (13) F2: "LIST"		SHET 2 1 2
F3: "AUTO '	(SPACE)	
F4: "RENUM"		
F5: "COLOR"		
SHIFT + F1: "CHR\$ ("		
SHIFT + F2: "DEF KEY ("		
SHIFT + F3: "CONT"		
SHIFT + F4: "SAVE"		
SHIFT + F5: "LOAD"	SHFT key is pressed together with other	

When one of these keys is pressed, the character string assigned to that key is entered; thus, statements which are frequently used can be entered just by pressing one key. The character string assigned to any of the definable function keys can be changed by the DEF KEY statement. (See page 57, DEF KEY statement.)

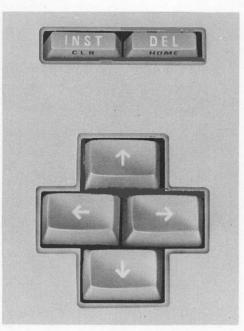

Definable function key label

Labels indicating the character strings assigned to definable function keys can be placed under the transparent cover located above these keys. The transparent sheet can easily be removed as shown below.

The cursor symbol is 🛍 in the graphic mode. To return the mode to normal, press the ALPHA key

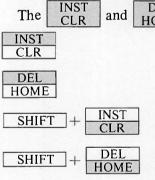

3.5.3 Cursor control keys and insert and delete keys

Cursor control keys and insert and delete keys

The cursor control keys are the four yellow keys at the right of the keyboard which are marked with arrows.

Pressing these keys moves the cursor one position in the direction indicated by the arrow. These keys are used when editing programs.

DEL HOME key have the following functions.

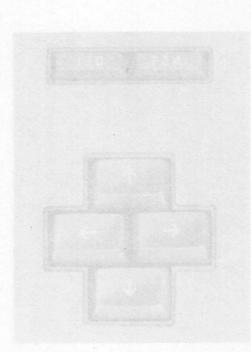

Inserts a space at the position of the cursor and shifts all following characters one position to the right. INST: insert.

Erases the character to the left of the cursor and shifts all following characters one position to the left. DEL: delete.

Clears the entire screen and returns the cursor to the screen's upper left corner. Pressing this key does not affect the program in memory. CLR: clear. Returns the cursor to the upper left corner of the screen (does not affect any characters displayed).

See pages 18 and 19.

3.5.3 Cursor control keys and insert and densite keys

Cursor control keys and insert and delete keys

The cursor control keys are the four yellow keys at the right of the keyboard which are marked with urrows.

key have the following functions.

Inserts a space at the position of the cursor and shifts all following characters one position to the right. INST: insert.

Erasss the character to the left of the cursor and shifts all following characters one position to the left DEL delete

Clears the entire screen and returns the cursor to the screen's upper left corner. Pressing this key does not affect the proposal memory. CLR: clear

TV CRAFACE-ITS displayed).

4.1 MZ-700 System Diagram

The figure below shows the system configuration of the MZ-700 series computers.

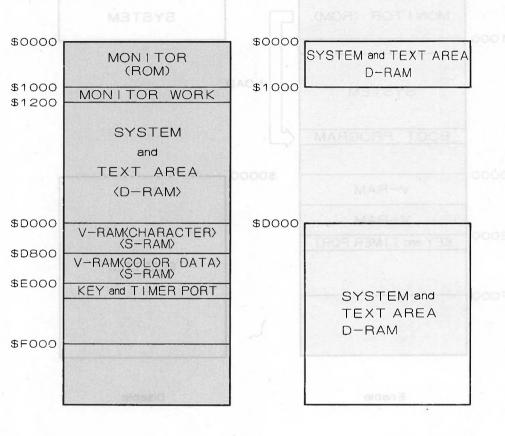

Notice: The contents of this chapter are for reference only, and Sharp cannot assume responsibility for aniwering any questions about its contents.

122

4.2 Memory configuration allow as a comment S.S.A.

4.2.1 Memory map at power-on (80k mode)

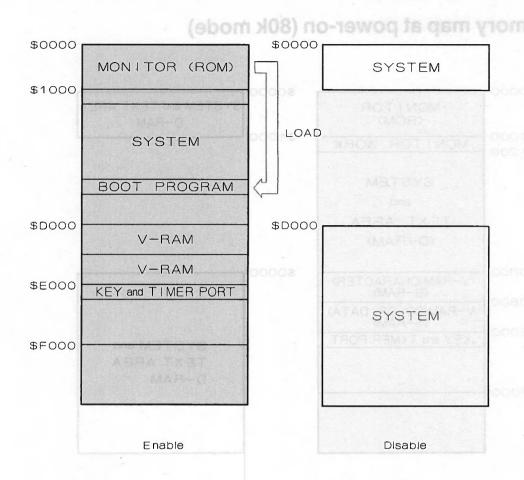

Enable

Disable

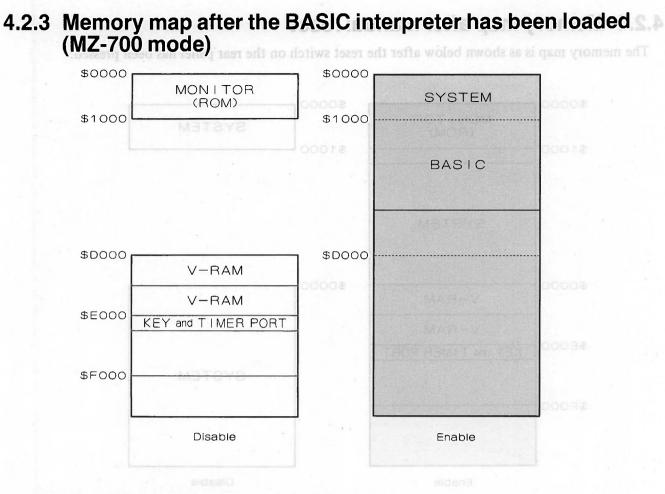

When the monitor LOAD command is entered, the bootstrap loader is loaded into the system R area from ROM and control is transferred to that program.

- The memory map is as shown above immediately after the power has been turned on. (The contents of the V-RAM area from \$D000 to \$DFFF are not the same as those of MZ-80K.)
- The entry point of the monitor ROM is the same as that of the MZ-80K.

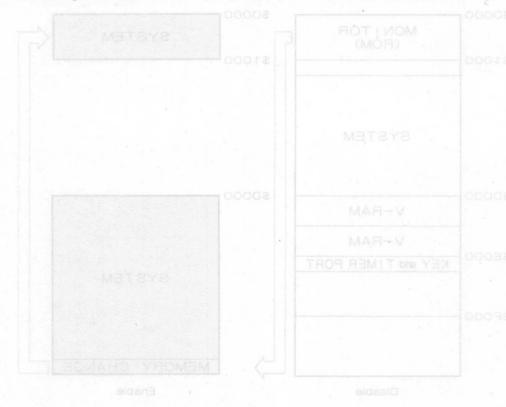

- When the monitor LOAD command is entered, the bootstrap loader is loaded into the system RAM area from ROM and control is transferred to that program.
- The memory map is as shown above immediately after the power has be J: DNAMMOD TOOB.
 If the V-RAM area from SD000 to SDFFF are not the same as those of MZ-80K.)
 The entry point of the monitor ROM is the same as that of the MZ-80K.

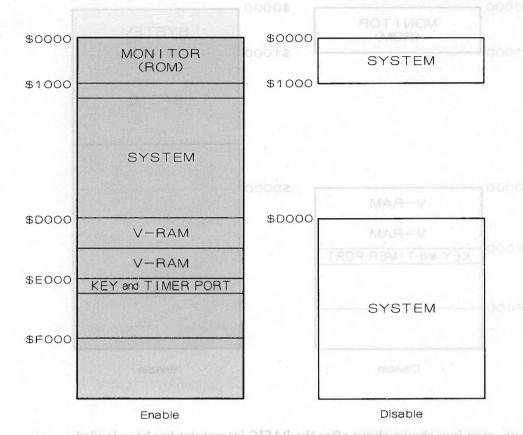

- The memory map is as shown above after the BASIC interpreter has been loaded.
- Bank switching is performed to access V-RAM or the KEY and TIMER PORT area.

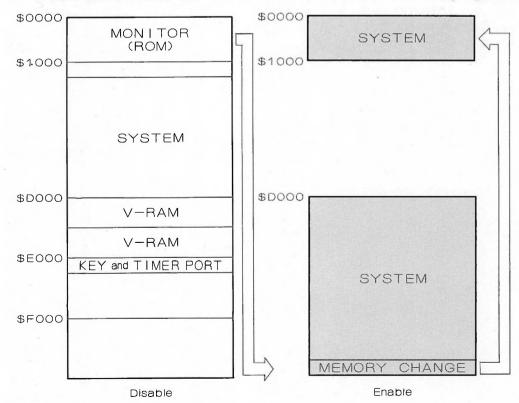

4.2.4 Memory map after manual reset

The memory map is as shown below after the reset switch on the rear panel has been pressed.

After pressing the reset switch together with the <u>CTRL</u> key, the memory map is as shown below.

- When the reset switch is pressed together with the <u>CTRL</u> key, addresses \$0000 to \$0FFF and from \$D000 to \$FFFF are assigned to RAM.
- When the # command is entered after the reset switch has been pressed, the computer operates in the same manner as after the reset switch has been pressed together with the <u>CTRL</u> key.

4.2.5 Bank switching

a) Memory blocks can be selected by outputting data to I/O ports as shown below.

SWITCHING	MAR-V ATAD P		
I/O PORT	\$0000~\$0FFF	\$D000~\$FFFF	
\$ E0	SYSTEM AREA (D-RAM)	8E000	
\$ E1		SYSTEM AREA (D-RAM)	1
\$ E2	MONITOR (ROM)		1
\$ E3		V-RAM, KEY, TIMER	1
\$ E4	MONITOR (ROM)	V-RAM, KEY, TIMER	ono
\$ E5		Inhibit	2.7
\$ E6	dis-	Return to the front of condition, where being inhibitted by \$ E5.	ily on

Note: Outputting data to I/O port \$E4 performs the same function as pressing the reset switch.

b) Examples:

OUT (\$E0), A

Assigns addresses \$0000 to \$0FFF to RAM, but does not change execution address. The contents of variable A do not affect the result.

OUT (\$E4), A

Initializes memory to the state immediately after the power has been turned on.

Note: Since the program counter is not moved by the OUT statement, care must be taken when switching memory blocks if the program counter is located in the area from \$0000 to \$0FFF or from \$D000 to \$FFFF.

4.2.6	Memory map when V-RAM is accessed	 When the reset switch is pre-
	inted to RAM.	

i) V-RAM (Video RAM) memory map

\$D000	e reset switch has been pressed toge	
\$D800		i k switching blocks can be sole
	COLOR DATA V-RAM	
\$E000	KEY and TIMER PORT	
	ON TOR (ROM)	
, KEY, TIMER		
dence between V-R	AM address	

ii) Correspondence between V-RAM address and location on the screen.The MZ-700 has a 2K byte V-RAM area,

but only 1K byte of that area can be displayed on the screen at one time. The area displayed can be changed by scrolling the screen.

a) Area displayed immediately after reset (or power-on): DOOO - Address

		D04E 79	D04F 80	OUT (SE4).

Note: Since the program counter is not moved by the OUT statement, care must be taken when switching memory blocks if the program counter is located in the area from \$0000 to \$0FFF or from

te immediately after the power has been tur

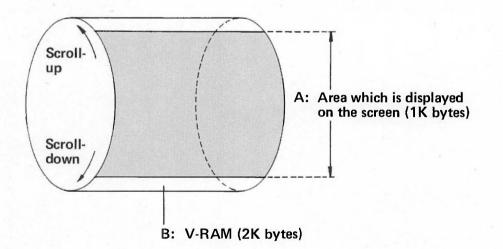

b) Area displayed after the screen has been scrolled up one line from the end of V-RAM:

Note: The line consisting of bytes 1 to 40 is wrapped around to that consisting of bytes 1961 to 2000 as shown above.

iii) Scroll-up and scroll-down

- a) The screen is scrolled up by pressing the SHIFT and t keys together, and is scrolled down by pressing the SHIFT and t keys together.
- b) Scroll-up and scroll-down

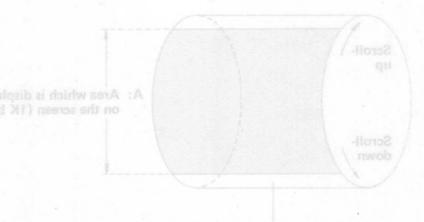

- During scrolling, the area which is displayed on the screen moves through the 2K byte V-RAM area as shown above.
- The end of the V-RAM area is warpped around to the beginning of V-RAM as shown above.
- The cursor does not move on the screen during scrolling.

4.3 Memory Mapped I/O (\$E000-\$E008)

Addresses E000 to E008 are assigned to the 8255 programmable peripheral interface, 8253 programmable interval timer and other I/O control ICs so that various I/O devices (including music functions using counter #0 of the 8253) can be accessed in the same manner as memory. The memory mapped I/O chart is shown below.

CPU memory address	Controller	Operation
\$E000 \$E001 \$E002 \$E003	8255	P _A : Output P _B : Input P _c : Input and output control by bit setting Mode control
\$E004 \$E005 \$E006 \$E007	8253	C ₀ : Mode 3 (square wave rate generator) C ₁ : Mode 2 (rate generator) C ₂ : Mode 0 (terminal counter) Mode control
\$E008	LS367, etc.	Tempo, joystick and HBLNK input

) Scroll-up and scroll-down

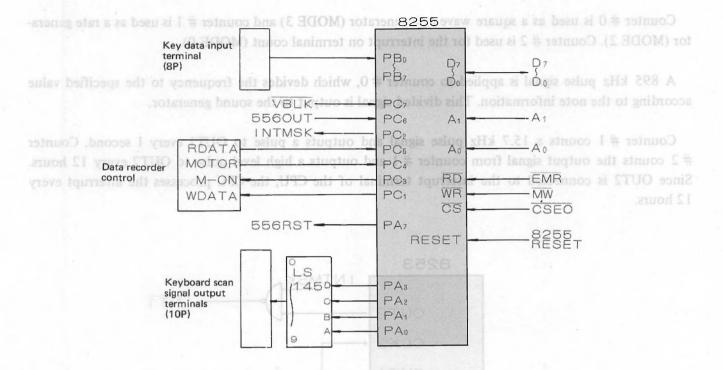

3: V-RAM (2K bytes)

- During scrolling, the area which is displayed on the screen moves through the 2K byte V-RAM area as shown above.
- The end of the V-RAM area is warpped around to the beginning of V-RAM as shown above.
 The cursor does not move on the screen during scrolling.

4.3.1 Signal system of the 8255

The 8255 outputs keyboard scan signals, input key data, and controls the cassette tape deck and cursor blink timing.

Port	Terminal	I/O	Active state	Description of control	Name of signal
PA (\$E000)	PA ₀ PA ₁ PA ₂ PA ₃ PA ₇	OUT	H H H H L	Keyboard scan signals Resets the cursor blink timer.	556 RST
PB (\$E001)	$\begin{array}{c} PB_0\\ PB_1\\ PB_2\\ PB_3\\ PB_4\\ PB_5\\ PB_6\\ PB_7\\ \end{array}$	IN	L L L L L L L L	Key scanning data input signals	
PC* (\$E002)	$\begin{array}{c} PC_1 \\ PC_2 \\ PC_3 \\ PC_4 \\ PC_5 \\ PC_6 \\ PC_7 \end{array}$	OUT OUT OUT IN IN IN IN	– L – H –	Cassette tape write data Inhibits clock interrupts. Motor drive signal Indicates that the motor is on. Cassette tape read data Cursor blink timer input signal Vertical blanking signal	WDATA INTMSK M–ON MOTOR RDATA 556 OUT VBLK

* Each output data bit can be independently set or reset.

4.3.2 Signal system of the 8253

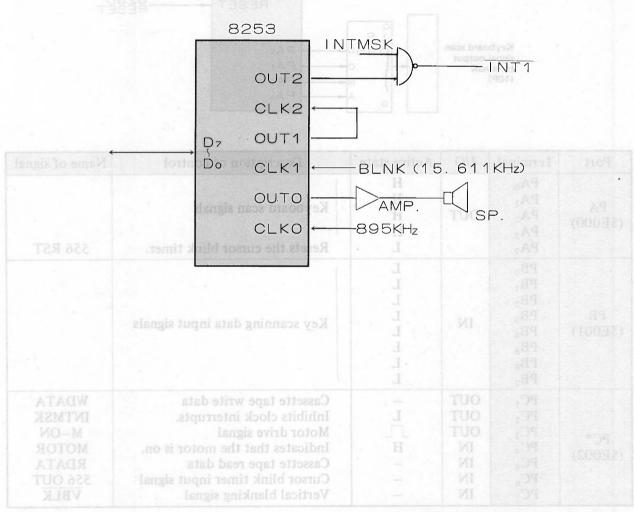

The 8253 includes three counters # 0, # 1 and # 2. Counter # 0 is used for sound generation, and counter # 1 and # 2 are used for the built-in clock.

4.3.1 Signal system of the 8255

Counter # 0 is used as a square wave rate generator (MODE 3) and counter # 1 is used as a rate generator (MODE 2). Counter # 2 is used for the interrupt on terminal count (MODE 0).

A 895 kHz pulse signal is applied to counter # 0, which devides the frequency to the specified value according to the note information. This divided signal is output to the sound generator.

Counter #1 counts a 15.7 kHz pulse signal and outputs a pulse to OUT1 every 1 second. Counter #2 counts the output signal from counter #1 and outputs a high level pulse to OUT2 every 12 hours. Since OUT2 is connected to the interrupt terminal of the CPU, the CPU processes the interrupt every 12 hours.

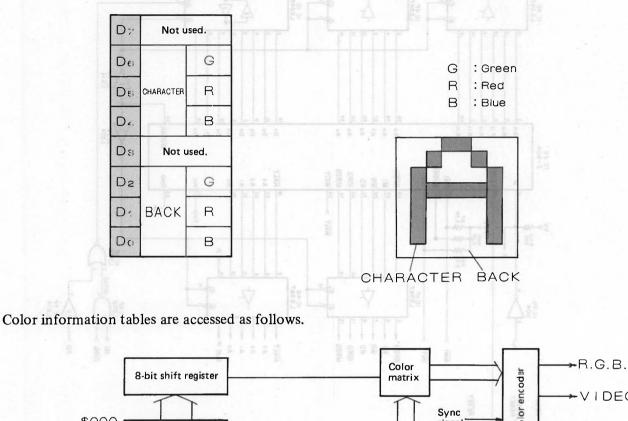

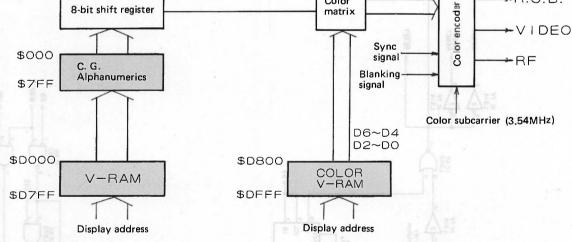

Each output data bit can be independently set or reset.

Signal System of Color V-RAM 4.4

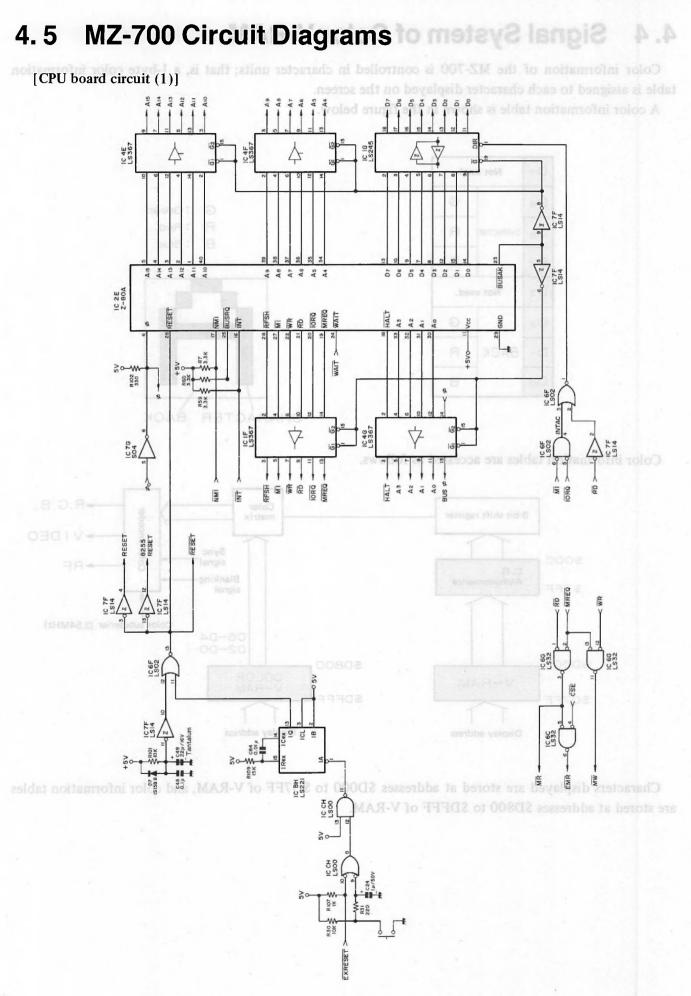

Color information of the MZ-700 is controlled in character units; that is, a 1-byte color information table is assigned to each character displayed on the screen.

A color information table is shown in the figure below.

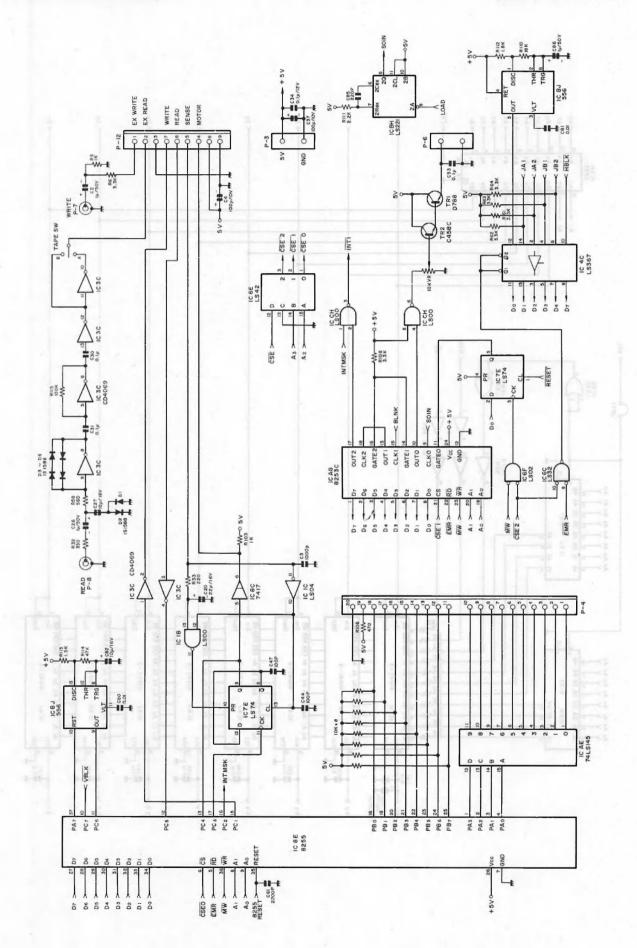

Characters displayed are stored at addresses \$D000 to \$D7FF of V-RAM, and color information tables are stored at addresses \$D800 to \$DFFF of V-RAM.

Monitor Commands and Subroutines

- Loads cassette tape files into memory.
- Outputs the specified character string to the printer. (Print)
 - Changes the contents of memory. (Memory correction)
 - Transfers control to the specified address. (Jum
- Saves the contents of the specified memory block to cassette tape. (Save)
 - ... Compares the contents of cassette tape with the contents of memory.
 - Transfers control to the RAM area.
- Makes the bell sound every time a key is pressed. Executing this continant again stors the bell.

te monitor work area

research of the monitor work area from \$1000 to \$11FF is shown below.

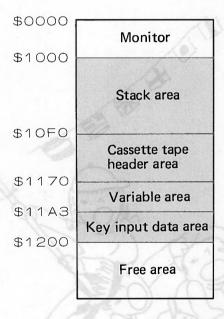

5.1 Monitor Commands

The monitor program starts immediately after the power is turned on and awaits input of a monitor command. The monitor commands are listed below. In this chapter, $|\overline{CR}|$ indicates that the carriage return key is to be pressed.

L command	Loads cassette tape files into memory.
P command	Outputs the specified character string to the printer. (Print)
M command	Changes the contents of memory. (Memory correction)
J command	Transfers control to the specified address. (Jump)
S command	Saves the contents of the specified memory block to cassette tape. (Save)
V command	Compares the contents of cassette tape with the contents of memory.
# command	Transfers control to the RAM area.
B command	Makes the bell sound every time a key is pressed. Executing this command
	again stops the bell.

Configuration of the monitor work area

The configuration of the monitor work area from \$1000 to \$11FF is shown below.

Note: The ROM monitor described in this chapter is not the same as the monitor function of the BASIC interpreter.

5.2 Functions and Use of Monitor Commands

This section describes the functions and use of the eight monitor commands.

- Commands are executed when the |CR| key is pressed. Characters must be entered in the correct order. If illegal characters (such as spaces) are included in a command string, the monitor rejects the command.
- All numeric data must be entered in hexadecimal form at, and all data is displayed in hexadecimal form at. Therefore, 1-byte data is represented with two hexadecimal digits and 2-byte data is represented with a four hexadecimal digits. For example, the decimal number 21 is displayed as 15 and the decimal number 10 must be typed in as 0A. The upper digit "0" cannot be omitted.
- If the number of characters typed as an operand exceeds the specified number, excess characters are discarded.
- Each command can access any location of memory. Therefore, the monitor program may be changed if the commands are used carelessly. Since this can result in loss of control over the system, be careful to avoid changing the contents of the monitor program.

This command is used to change the contents of memory a J

5.2.1 L command

Format Function

This command loads the first machine language file encountered on the cassette tape into memory. After the L command is entered, the display changes as follows.

*LJ • PLAY

Press the PLAY key of the data recorder. When a machine language program is found, the message "LOADING program-name" is displayed. For example, the following message is displayed during loading of the BASIC interpreter.

LOADING BASIC

Function	This command is used as follows to co

h h h h destination address This command transfers control to the specified address; i.e., it sets the specified address in the program counter.

 $* J 1 2 \emptyset \emptyset J$ Jumps to address \$1200.

5.2.5 S command (S : Save)

MUZ NOTHO spectrum h' h' h' h' end address might be tadt restarting of

h" h" h" h" … execution address

Upon execution, this command prompts for entry of a file name, then saves the contents of memory from h h h h to h' h' h' on cassette tape under the specified file name. Assume that a machine language program in the area from \$6000 to \$60A3 whose execution address is at \$6050 is to be saved under file name "MFILE"; the command is then entered as follows.

X S 6 10 00 6 0 A 3 6 10 5 0 J

FILENAME? METTER

+ RECORD.PLAY

Confirm that a blank cassette tape is loaded in the data recorder and press the **RECORD** key.

5.2.8 B command (B : Bell)

If the write protect tab of the cassette tape is removed, the <u>RECORD</u> key cannot be pressed. Replace it with another cassette.

This command can only be used to save machine language programs.

```
WRITING MFILE
OK!
```

Note: To abort recording, hold down both the SHIFT and BREAK keys until the prompt " * " appeas.

5.2.6 V command (V : Verify)

Forma	at
Functio	on

Compares a machine language cassette file saved using the S command with the original program in memory.

*VJ + PLAY OK

Press the PLAY key to read the cassette tape file when the prompt " $\bot \ \square \square \square \square \square$ " is displayed. The message "OK" is displayed when the contents of the cassette file matches that of the original program; otherwise, the message "CHECK SUM ER." is displayed.

It is recommended to that this command be executed immediately after recording a program with the S command.

5.2.7 # command

Format Function

After pressing the RESET switch, executing this command produces the same effect as simultaneoulsy pressing the RESET switch and the CTRL key. * # J

5.2.8 B command (B : Bell)

#

Format
Function

*B1

Executing this command once causes the bell to ring each time a key is pressed. Executing it again disables the bell.

This command can only be used to save machine language program

Note: To abort recording, hold down both the <u>SHIFT</u> and <u>BREAK</u> keys until the prompt " * " appeas.

5.3 Monitor Subroutines

The following subroutines are provided for Monitor 1Z-013A. Each subroutine name symbolically represents the function of the corresponding subroutine. These subroutines can be called from user programs.

Registers saved are those whose contents are restored when control is returned to the calling program. The contents of other registers are changed by execution of the subroutine.

Name and entry point (hex.)	Function	Register saved	
CALL LETNL (0006)	Moves the cursor to the beginning of the next line.	Other than AF	
CALL PRINTS (000C)	Displays a space at the cursor position.	Other than AF	
CALL PRINTS (0012)	Displays the character corresponding to the ASCII code stored in ACC at the cursor position. See Appendix A. 1 for the ASCII codes. No character is displayed when code 0D (carriage return) or 11 to 16 (the cursor control codes) is entered, but the corresponding function is performed (a carriage return for 0D and cursor movement for 11 to 16).	Other than AF	
CALL MSG (0015)	Displays a message, starting at the position of the cursor. The starting address of the area in which the message is stored must be set in the DE register before calling this subroutine, and the message must end with a carriage return code (0D). The carriage return is not executed. The cursor is moved if any cursor control codes (11 to 16) are included in the message.	All registers	
CALL BELL (003E)	Briefly sounds high A (about 880 Hz).	Other AF	
CALL MELDY (0030)	Plays music according to music data stored in the memory area starting at the address indicated in the DE register. The music data must be in the same format as that for the MUSIC statement of the BASIC, and must end with 0D or C8. When play is completed, control is returned to the calling program with the C flag set to 0; when play is interrupted with the BREAK key. control is returned with the C flag set to 1.	Other than AF	
CALL XTEMP (0041)	Sets the musical tempo according to the tempo data stored in the accumulator (ACC). ACC $\leftarrow 01$ Slowest speed ACC $\leftarrow 04$ Middle speed ACC $\leftarrow 07$ Highest speed Note that the data in the accumulator is not the ASCII code corresponding to 1 to 7 but the binary code.	All registers	
CALL MSTA (0044)	Generates a continuous sound of the specified frequency. The frequency is given by the following equation. freq. = 895 kHz/nn'. Here, nn' is a 2-byte number stored in addresses 11A1 and 11A2 (n in 11A2 and n' in 11A1).	BC and DE	

Name and entry point (hex.)	8	Function	Monito	Register saved						
CALL MSTP (0047)	Stops the sound generated with the CALL MSTA subroutine.									
CALL TIMST (0033)	Sets and starts the built-in clock. Registers must be set as follows before this routine is called. ACC ← 0 (AM), ACC ← 1 (PM) DE ← 4-digit hexadecimal number representing the time in seconds.									
CALL TIMRD (003B)	Reads the built-in clock and returns the time as follows. ACC ← 0 (AM), ACC ← 1 (PM) DE ← 4-digit hexadecimal number representing the time in seconds.									
CALL BRKEY (001E)		HIFT and BREAK ke g is set when they are bein se, it is reset.		Other than AF						
CALL GETL (0003)	memory area starting at register. This routine sto key is pressed, then appe the end of the data read. A maximum of 80 chara code) can be entered in of Characters keyed in are e control codes can be incl When the SHIFT an simultaneously, BREAK	cters (including the carria one line. echoed back to the display	ne DE RETURN (0D) to ge return , and cursor essed ress indicated	All registers						
CALL GETKY (001B)	If no key is pressed, con- with 00 set in ACC. No provision is made to chatter, and characters en- the display. When any of the special subroutine returns a cod ing ASCII code as shown	ASCII) from the keyboard trol is returned to the call avoid data read errors due ntered are not echoed back keys (such as DEL or C e to ACC which is different below. Name and entry point (hex.)	Function									
CALL ASC (03DA)	Sets the ASCII character corresponding to the hexadecimal number represented by the lower 4 bits of data in ACC.	Other than AF								
CALL HEX (03F9)	Converts the 8 data bits stored in ACC into a hexadecimal number (assuming that the data is an ASCII character), then sets the hexadecimal number in the lower 4 bits of ACC. The C flag is set to 0 when a hexadecimal number is set in ACC; otherwise, it is set to 1.									
CALL HLHEX (0410)	Converts a string of 4 ASCII characters into a hexadecimal number and sets it in the HL register. The call and return conditions are as follows. DE ← Starting adress of the memory area which contains the ASCII character string (e.g., "3" "1" "A" "5") CALL HLHEX 1_ DE CF = 0 HL ← hexadecimal number (e.g., HL = 31A5 H) CF = 1 The contents of HL are not assured.	Other than AF and HL								
CALL 2HEX (041F)	Converts a string of 2 ASCII characters into a hexadecimal number and sets it in ACC. The call and return conditions are as follows. DE ← Starting adress of the memory area which contains the ASCII character string. (e.g., "3" "A") CALL 2HEX L DE CF = 0 ACC ← hexadecimal number (e.g., ACC = 3A _H) CF = 1 The contents of the ACC are not assured.	Other than AF and DE								
CALL ??KEY (09B3)	Blinks the cursor to prompt for key input. When a key is pressed, the corresponding display code is set in ACC and control is returned to the calling program.	Other than AF								
CALL ?ADCN (0BB9)	Converts ASCII codes into display codes. The call and return conditions are as follows. ACC ← ASCII code CALL ? ADCN ACC ← Display code	Other than AF								
CALL ?DACN (0BCE)	Converts display codes into ASCII codes. The call and return conditions are as follows. ACC ← Display code CALL ? DACN ACC ← ASCII code	Other than AF								
CALL ?BLNK (0DA6)	Detects the vertical blanking period. Control is returned to the calling program when the vertical blanking period is entered.	All registers								
	Controls display as follows.									
CALL ?DPCT (0DDC)	ACCControlACCControlCOHScrollingC6HSame as the CLR key.C1 HSame as the I key.C7HSame as the DEL kev.C2 HSame as the I key.C8HSame as the INST kev.C3 HSame as the I key.C9HSame as the ALPHA key.C4 HSame as the I key.CDHSame as the CR key.C5 HSame as the HOME key.CHSame as the CR key.									
CALL ?PONT (0FB1)	Sets the current cursor location in the HL register. The return conditions are as follows. CALL ? PONT HL ← Cursor location (binary)	Other than AF and HL								

than AF	Sets the ASCII character corresponding to the hexade imal number represented by the lower 4 bits of data in ACC.	
Other than AF	Converts the 8 data bits stored in ACC into a hexadecimal number (assuming that the data is an ACII character), then sets the hexadecimal number in the lower 4 bits of ACC. The C flag is set to 0 when a hexadecimal number is set in ACC; otherwise, it is set to 1.	
	Converts a string of 4 ASCH characters into a hexadecimal mathematical set in the HL resider. The call and return the ASCII character string $CF = 0$ HL \leftarrow hexadecimal number (e.g., HL - 31A5u) CF = 1 The contents of HL are not assured	
	Converts a string of 2 ASCII characters into a heradectical mathematical sets it in ACC. The call and return conditions DE - Starting address of the memory area which contains the ASCII character string (e.g., ACC - 3A ₄) $CF = 0$ ACC \leftarrow hexadecimal number (e.g., ACC - 3A ₄) CF = 1 The contents of the ACC are not assured.	
Other than AF	pressed, the corresponding display code is set in ACC and control is returned to the calling program.	
	• onverts ASCII codes into display colles. The call and setur conditions are as follows. AC - ASCII code	
	ACC ← ASCII codes. The call and return conditions are as follows. ACC ← Display code ACC ← ASCII code	
All registers	Caling program when the varical blanking period. Control is entered to the caling program when the varical blanking putiod is entered	
	Controls display as follows. Scroling Scroling Same as the Elev. Same as the Elev.	
	current cursor location in the HL register. The return $HL \leftarrow Cursor location (binarv)$	

and Tables

And the most significant digit, and represents **APPENDICES** in the statisticant digit, and represents **APPENDICES** in the statistic executing CALL PRVT (a monitor submutine) with 154 and unser to the home position. (* 11 'is not displayed.)

A.1 Code Tables

ASCII code table

MSD is an abbreviation for most significant digit, and represents the upper 4 bits of each code; LSD is an abbreviation for least significant digit, and represents the lower 4 bits of each code. Codes 11_H to 16_H are cursor control codes. For example, executing CALL PRNT (a monitor subroutine) with 15_H set in ACC returns the cursor to the home position. (" \blacksquare " is not displayed.)

Display code table

The display codes are used to address character patterns stored in the character generator. These codes must be transferred to video-RAM to display characters.

Monitor subroutines PRNT (0012 μ) and MSG (0015 μ) convert ASCII codes into display codes and transfer them to the V-RAM location indicated for the cursor.

Codes Cl_H to C6_H are for controlling the cursor.

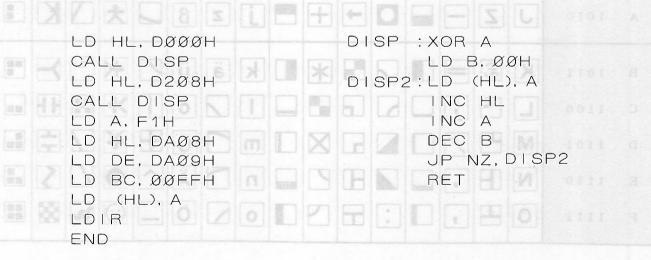

The character patterns on the former page are contained in the 2K bytes which make up the first half of CG-ROM. Character patterns for the second half of CG-ROM are shown on the latter page. However, character patterns in the second 2K bytes of the CG-ROM are not supported by BASIC, and cannot be entered directly from the keyboard. Although they can be displayed using the POKE statement as shown in the example below, they cannot be output to any printer (either the built-in printer or an external printer).

< Examples >

(1) The following program example displays character patterns from the second half of CG-ROM on the CRT screen.

10 COLOR, , 7, 0 20 PRINT "C"; 55296 =\$D800 ЗØ FOR J=55296 TO 56296 POKE J, 24Ø 4Ø Specifies the second 2K-byte half of CG-ROM. 240 =\$F0 5Ø NEXT J 6Ø A=53248: I=0:H=0 53248 = \$D000 POKE A, I 7Ø A = A + 28Ø THEN 9Ø | = | + 1 : | F|=256GOTO 12Ø 1ØØ H=H+1: | F H=2Ø THEN $A = A + 4\emptyset : H = \emptyset$ 11Ø GOTO 7Ø 120 GOTO 120

(2) The example below illustrates using machine language to display character patterns from the second half of CG-ROM on the CRT screen.

MZ-700 Display code table (second 2K-byte half)

ASCII code table for color piorter-printer

Graphic characters other than those shown above cannot be printed, but the corresponding hazadecimal code is printed in a different pen color.

Data transfer	Attachments for the color plotter-printer are listed later.
rate:	1200 bps (typ.)

A.2.5 Power supply specifications

(Supplies power to	the color plotter-printer and data recorder, as well as to the main unit.)
Input:	240/220 V ±10%, 50/60 Hz, 20 W
Output:	5 V

A. 3 BASIC Error Message List

The BASIC interpreter displays an error message in one of the following formats when an error occurs during operation.

1. < error type > error(Direct mode error)2. < error type > error in line number (Run mode error)

Error messages in format 1 are issued when an error is detected during execution of a direct command or entry of a program. Error messages in format 2 are issued when an error is detected during program execution.

Error messages which may be displayed are shown below.

SYNTAX

Error No.	Message displayed	Jan Cro	Description
1	Syntax error		Syntax error
2	Over flow error	bb.(nn)	Numeric data used is out of the specified range, or an overflow occurred.
3	Illegal data error		Illegal constant or variable was used.
5	String length error		String length exceeded 255 characters.
6	Memory capacity error	XI (GRI)	Memory capacity is insufficient.
7	Array def. error		An attempt was made to redefine an array to a size greater than that defined previously.
8	Linelength error	· YI (an)	The length of a line was too long.
10	GOSUB nesting error		The number of levels of GOSUB nesting exceeded the limit determined by the usable memory space.
11	FOR~NEXT error	SP, HL	The number of levels of FOR~NEXT loops exceed-
the fat	SP1X	20,98	ed the limit determined by the usable memory area.
12	DEF FN nesting error	vh ,48	The number of levels of DEF FN nesting exceeded the limit.
13	NEXT error	DD H	NEXT was used without a corresponding FOR.
14	RETURN error		RETURN was used without a corresponding GOSUB.
15	Un def. function error	XI H	An undefined function was called.
16	Un def. line num. error		An unused line number was referenced.
17	Can't continue	YI HE	CONT command cannot be executed.
18	Memory protection	DD 1	An attempt was made to write data to the BASIC control area.
19	Instruction error	XI	Direct mode commands and statements are mixed together.
20	Can't RESUME error	YI -	RESUME cannot be executed.
21	RESUME error		An attempt was made to execute RESUME when no
	the base sectored at the base bis	non anna	error had occurred.
24	READ error	a de aderes	READ was used without a corresponding DATA
THE REAL PROPERTY	If 3H50	JH ,30	statement.
43	Already open error	AF, AF	An OPEN statement was issued to a file which was already open.
63	Out of file error		Out of file during file read.
65	Printer is not ready	SP). HL	Printer is not connected.
68	Printer mode error		Color plotter-printer mode error.
70	Check sum error	(SP), IX	Check sum error (during tape read).

A. 4 Z80A Instruction Set passed from 3 Cl2A8 C.A

Since the starting address of Monitor 1Z-013A is set to \$0000, relocatable addresses and object codes in the assembly list can be assumed as absolute addresses and object code, respectively.

This assembly list is provided for reference, only and the Sharp Corporation can assume no responsibility for answering any question about it.

Note that this monitor differs from the monitor program included in the BASIC interpreter.

A. 6 Color Plotter-Printer Control Codes

A.6.1 Control codes used in the text mode

- Text code (\$01) Sets the printer in the text mode.
- Graphic code (\$02) Same as the BASIC MODE GR statement. Sets the printer in the graphic mode.
- Line up (\$03) Same as the BASIC SKIP-1 statement. Moves the paper one line in the reverse direction. The line counter is decremented by 1.
- Pen test (\$04) Same as the BASIC TEST statement. Writes the following patterns to start ink flowing from the pens, then sets scale = 1 (40 chr/line), color = 0.

- Reduction scale (\$09) + (\$09) + (\$09)
 Reduces the scale from 1 to 0 (80 chr/line).
- Reduction cancel (\$09) + (\$09) + (\$0B) Enlarges the scale from 0 to 1. (40 chr/line).
- Line counter set $(\$09) + (\$09) + (ASCII)_2 + (ASCII)_1 + (ASCII)_0 + (\$0D)$

..... Same as the BASIC PAGE statement.

- Specifies the number of lines per page as indicated by 3 bytes of ASCII code. The maximum number of lines per page is 255. Set to 66 when the power is turned on or the system is reset.
- Line feed (\$0A) Same as the BASIC SKIP 1 statement. Moves the paper one line in the forward direction. The line counter is incremented by 1.
- Magnify scale (\$0B) Enlarges the scale from 1 to 2 (26 chr/line).
- Magnify cancel (\$0C)
 - Reduces the scale from 2 to 1.
- Carriage return (\$0D) Moves the carriage to the left side of the print area.
- Back space (\$0E) Moves the carriage one column to the left. This code is ignored when the carriage is at the left side of the print area.
- Form feed (\$0F)

Moves the paper to the beginning of the next page and resets the line counter to 0.

• Next color (\$1D) Changes the pen to the next color.

A.6.2 Character scale

- The character scale is automatically set to 1 (40 chr/line) when the power is turned on. Afterwards, it can be changed by the control codes and commands.
- In the graphic mode, the scale can be changed in the range from 0 to 63.
- The scale is set to 1 when the mode is switched from graphic to text.

A.6.3 Graphic mode commands

A. 6. 3. 1 Command type

Leading blanks are ignored.

In the graphic mode, the printer can be controlled by outputting the following commands to the printer. Words in parentheses are BASIC statements which have the same functions as the graphic mode commands.

Command name	Format	Function
LINE TYPE	Lp (p = 0 to 15)	Specifies the type of line (solid or dotted) and the dot pitch. $p = 0$: solid line, $p = 1 \sim 15$: dotted line $p = p$
ALL INITIALIZE	A	Sets the printer in the text mode.
HOME (PHOME)	er command without enterin	Lifts the pen and returns it to the origin (home position).
INITIALIZE (HSET)	ne as "H' CR " D100, 200" nd with one parameter by	Sets the current pen location as the origin $(x = 0, y = 0)$.
DRAW (LINE)	$Dx, y, \dots xn, yn (-999 \leq x, y \leq 999)$	Draws lines from the current pen location to coordinates (x_1, y_1) , then to coordinates (x_2, y_2) , and so forth.
RELATIVE DRAW (RLINE)	$J_{\Delta x, \Delta y \dots \Delta xn, \Delta yn} (-999 \leq \Delta x, \Delta y \leq 999)$	Draws lines from the current pen location to relative coordinates $(\Delta x_1, \Delta y_1)$, then to relative coordinates $(\Delta x_2, \Delta y_2)$ and so forth.
MOVE (MOVE)	Mx, y (-999 $\leq x, y \leq 999$)	Lifts the pen and moves it to coordinates (x, y) .
RELATIVE MOVE (RMOVE)	$ \begin{array}{c} R \triangle x, \triangle y \\ (-999 \leq \triangle x, \triangle y \leq 999) \end{array} $	Lifts the pen and moves it to relative coordinates $(\Delta x, \Delta y)$.
COLOR CHANGE (PCOLOR)	Cn (n = 0 to 3)	Changes the pen color to n.
SCALE SET	Sn (n = 0 to 63)	Specifies the character scale.
ALPHA ROTATE	Qn (n = 0 to 3)	Specifies the direction in which characters are printed.
PRINT	$\operatorname{Pc}_1 \operatorname{c}_2 \operatorname{c}_3 \ldots \operatorname{cn} (n = \infty)$	Prints characters.
AXIS (AXIS)	Xp, q, r (p = 0 or 1) (q = -999 to 999) (r = 1 to 255)	Draws an X axis when $p = 1$ and a Y axis when $p = 0$. q specifies the scale pitch and r specifies the number of scale marks to be drawn.

A. 6. 3. 2 Command format

There are 5 types of command formats as shown below.

1. Command character only (without parameters)

 $^{"}A", "H", "I"$

- 2. Command character plus one parameter "L", "C", "S", "Q"
- 3. Command character plus pairs of parameters "D', "J', "M', "R"

"," is used to separate parameters, and a CR code is used to end the parameter list.

4. Command plus character string

" **P** "

The character string is terminated with a CR code.

5. Command plus three parameters

 $^{\rm e} \mathbf{X}^{\rm a}$

"," is used to separate parameters.

A. 6. 3. 3 Parameter specification

- 1. Leading blanks are ignored.
- 2. Any number preceded by " -- " is treated as a negative number.
- 3. If the number of digits of a number exceeds 3, only the lower 3 digits are effective.
- 4. Each parameter is ended with "," or a CR code. If other than numbers are included in a parameter, subsequent characters are ignored until a comma or CR code is detected.

Example) D____ -135. 21,

A. 6. 3. 4 Abbreviated formats

- Any command can be followed by a one-character command without entering a CR code.
 Ex) "HD100, 200" CR is effective and is the same as "H" CR "D100, 200" CR.
- 2. Any command can be followed by a command with one parameter by separating them with a comma ",".

Ex) "L0, S1, Q0, C1, D100, 200" CR is effective.

p = 0: solid line, $p = 1 \sim 15$: dotted line

3. A command with pairs of parameters must be terminated with a CR code.

4. 6. 3. 5 Data change due to mode switching

The following data changes when the printer is switched from the graphic mode to the text mode.

• X and Y coordinates

Y is set to 0 and the origin is placed at the left side of the printable area.

- Direction of characters
 Q is set to 0.
 Character scale
- Character scale is set to 1.
- The line type setting is not affected.

There are 5 types of command formats as shown held

- Command character only (without parameters)
 - I, H, A
 - Command character plus one parameter
 - 5.5.5.7
 - Command enaracter plus paus of parameters
 - 21 . M . L . U

, is used to separate parameters, and a CK code is used to end the parameter list.

- . Command plus character string
- The character string is terminated with a CR code
 - Command plus three parameters
 - 13

is used to separate parameters

A.7 Notes Concerning Operation

Data recorder

• Although the data recorder of the MZ-700 is highly reliable, the read/write head will wear out after prolonged use. Further, magnetic particles and dust will accumulate on the head, degrading read/write performance. Therefore, the head must be cleaned periodically or replaced when it becomes worn.

Do not rotate the pen drum in the reverse direction when replacing pens.

Be sure to remove the pens from the pen drum, replace their caps to them, and st

- 1. To clean the head, open the cassette compartment, press the <u>PLAY</u> key, and wipe the head and pinch roller using a cotton swab. If they are very dirty, soak the cotton swab in alcohol.
- 2. When the head becomes worn, contact your dealer. Do not attempt to replace it by yourself.
- Cassette tape
- Any commercially available cassette tape can be used with the MZ-700. However, it is recommended that you use quality cassette tape produced by a reliable manufacturer.
 - Use normal type tapes.
 - Avoid using C-120 type cassette tapes.
 - Use of C-60 or shorter cassette tapes is recommended.
 - Be sure to take up any the slack in the tape with a pencil or the like as shown at right before loading the cassette tape: otherwise, the tape may break or become wound round the pinch roller.
- Protecting programs/data from accidental erasure

The data recorder of the MZ-700 is equipped with a write protect function which operates in the same manner as with ordinary audio cassette tape decks.

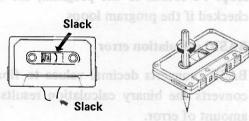

To prevent data from being accidentally erased, remove the record lock-out tab from the cassette with a screwdriver or the like. This makes it impossible to press the <u>RECORD</u> key, preventing erasure of, valuable data.

Other

- See page 109 for commercially available cassette tape decks.
- Display unit

When using a display unit other than one specified for the MZ-700, the screen size must be adjusted. See page 106.

Although the practical result of the equation in line 10 is 1, this program prints FALSE because of

Color plotter-printer

Remove record lock-out tab with a screwdriver. Tab for side A

Tab for side B

• Color plotter-printer

- Do not rotate the pen drum in the reverse direction when replacing pens.
- Be sure to remove the pens from the pen drum, replace their caps to them, and store them in the case to prevent them from drying out when the printer is not to be used for an extended period of time.

Notes Concerning Operation

Use normal type tapes.

Avoid using C-120 type cassette tapes.

- It takes a certain amount of time for ink on the paper to dry. (The ink is water-soluble.)
- Do not rip off the paper when the printer cover is removed. Hold down the paper holder when ripping off the paper.
- Do not touch the internal mechanism when replacing the pens. Failure to observe this warning may result in damage to the printer.
- The color plotter printer generates sound for a moment when the power is turned on. This is not a problem.
- Letters printed in the 80 character line mode may be difficult to read. In this case, use the 40 character/ line mode.
- In the graphic mode, lines printed repeatedly may become blurred. This is particularly liable to occur when a dotted line is printed repeatedly. Due to the characteristics of the ball pen, this is unavoidable.

Notes concerning software

- It takes about 3 minutes to load the BASIC interpreter.
- The reset switch on the rear panel is to used in the following cases. (See 3. 1. 1.) To stop execution of a BASIC program during normal execution or when the program enters an infinite loop. To return to the program, use the # command. However, the program or hardware should be checked if the program loops.

BASIC calculation error

• BASIC converts decimal values to floating point binary values before performing calculations, then converts the binary calculation results into decimal numbers for display. This can result in a certain amount of error.

(Example:)

PRINT 817. 3–81Ø. 4 6. 899999Correct result is 6.9.

- Approximations are made during calculation of functions and exponentiation.
- The above must be considered when using IF statements.

(Example:)

```
10 A=1/100*100
20 IF A=1 THEN PRINT"TRUE" :GOTO 40
30 PRINT "FALSE"
40 PRINT "A=";A
50 END
RUN
FALSE
A=1
```

Although the practical result of the equation in line 10 is 1, this program prints FALSE because of error due to conversion.

Notes concerning handling

Power switch

The power switch should be left untouched for at least 10 seconds after being turned on or off. This is necessary to ensure correct operation of the computer. Do not unplug the power cable when the power switch is on: otherwise, trouble may result.

Power cable

Avoid placing heavy objects such as desks on top of the power cable. This may damage the power cable, possibly resulting in a serious accident. Be sure to grasp the cable by the plug when unplugging it.

• Power supply voltage

The power supply voltage is 240/220 VAC. The computer may not operate properly if the voltage is too high or too low. Contact your dealer for assistance if you experience this problem.

Ventilation

Many vents are provided in the cabinet to prevent overheating. Place the computer in a well ventilated place, and do not cover it with a cloth. Do not place any objects on the left side of the computer, since this is where the vents for the power supply unit are located.

• Humidity and dust

Do not use the computer in a damp or dusty places.

Temperature

Do not place the computer near heaters or in places where it may be exposed to direct sunlight; failure to observe this precaution may result in damage to the computer's components.

Water and foreign substances

Water and other foreign substances (such as pins) entering the computer will damage it. Unplug the power cable immediately and contact your dealer for assistance if such an accident occurs.

Shock

Avoid subjecting the computer to shock; strong shocks will damage the computer permanently.

• Trouble

Stop immediately operation and contact your dealer if you note any abnormality.

Prolonged disuse

Be sure to unplug the power cable if the computer is not to be used for a prolonged period of time.

Connection of peripheral devices

Use only parts and components designated by Sharp when connecting any peripheral devices, otherwise, the computer may be damaged.

• Dirt

Wipe the cabinet with a soft cloth soaked in water or detergent when it becomes dirty. To avoid discoloration of the cabinet, do not use volatile fluids such as benzene.

· Noise

• Noise

Notes concerning handling

It is recommended that a line filter be used when the computer is used in a place where high level noise signals may be present in the AC power. (A line filter can be obtained from your Sharp dealer). Move the signal cables as far as possible from the power cable and other electrical appliances.

• RF interference

Interference with TV or radio reception may occur due to the RF signal generated by the computer if it is used near a TV or radio set. TV sets generate a strong magnetic field which may result in incorrect operation of the computer. If this occurs, move the TV set at least 2 to 3 meters away from the computer.

Power supply voltage

The power supply voltage is 240/220 VAC. The computer may not operate properly if the voltage is too high or too low. Contact your dealer for assistance if you experience this problem.

Ventilation

Many vents are provided in the cabinet to prevent overheating. Place the computer in a well ventilated place, and do not cover it with a cloth. Do not place any objects on the left side of the computer, since this is where the vents for the power supply unit are located.

· Humidity and dust

Do not use the computer in a damp or dusty places.

Temperature

Do not place the computer near heaters or in places where it may be exposed to direct sunlight; ailure to observe this precaution may result in damage to the computer's components.

Water and foreign substances

Water and other foreign substances (such as pins) entering the computer will damage it. Unplug the power cable immediately and contact your dealer for assistance if such an accident occurs.

· Shock

tvoid subjecting the computer to shock; strong shocks will damage the computer permanently.

• Trouble

This apparatus complies with requirements of EEC directive 76/889/EEC.

· Prolonged disuse

e sure to unplug the power cable if the computer is not to be used for a prolonged period of time.

Connection of peripheral devices

Use only parts and components designated by Sharp when connecting any peripheral devices, otherwise, the computer may be damaged.

· Dirt

Wipe the cabinet with a soft cloth soaked in water or detergent when it becomes dirty. To avoid discoloration of the cabinet, do not use volatile fluids such as benzene.

Copying/Debugging of MZ-700 Basic Interpreter

A. Please follow the procedure below mentioned to copy the BASIC tape.

- 1) Power on MZ-700 (\rightarrow monitor state)
- 2) Partial memory should be modified by the use of monitor command M (memory correction) as follows:

*MCF0	0		
CF00	$FF \rightarrow CD$		
CF01	$00 \rightarrow 27$		
CF02	$FF \rightarrow 00$		
CF03	$00 \rightarrow 38$		
CF04	$FF \rightarrow 03$		
CF05	$00 \rightarrow CD$		10.1
CF06	$FF \rightarrow 2A$	Push <u>RECORD</u> button. The copy will start and the following indication	
CF07	$00 \rightarrow 00$		
CF08	$FF \rightarrow DA$		
CF09	$00 \rightarrow FE$		
CF0A	$FF \rightarrow 00$	On the occasion of MZ-711, item 9) should be effectuated after setting in recording state.	
CF0B	$00 \rightarrow C3$	After the sound "Pit Pit", the copy will be terminated.	
CF0C	$FF \rightarrow AD$	The monitor state will be recovered by pushing the rear RESET SW.	
CF0D	$00 \rightarrow 00$	Rewind the tape and push STOP button.	
CF0E	$FF \rightarrow CD$	Key in as follows:	
CF0F	$00 \rightarrow 27$		
CF10	$FF \rightarrow 00$		
CF11	$00 \rightarrow 38$		
CF12	$FF \rightarrow F5$		
CF13	$00 \rightarrow C3$	Push [PLAY] button of the recorder and the "VERIFY" function will b	
CF14	$FF \rightarrow CB$	ful verified, the indication of "OK!" will appear though no other indicat	
CF15	$00 \rightarrow 0F$	will appear. When error occured, please restart from the item 4).	

SHIFT + BREAK to be keyed in.

NOTE: The content of memory from CF00 to CF15 may not always be as above mentioned.

- 3) The cassette to be read (copyed from) should be set to the tape recorder.
- 4) Key in the monitor command J (Jump) as follows:

* JCF00 [CR] \pm PLAY

NOTE: If a button of the tape recorder is still pushed no play indication will appear.

- 5) Confirming the "**⊥**PLAY" indication above mentioned, push <u>PLAY</u> button and load the content of BASIC tape. On this occasion, no indication like FILE NAME, etc. will be shown. When ERROR occured, please restart from the item 1) again.
- 6) Set a new cassette to which the BASIC should be written into the recorder and execute REWIND .

7) Key in as follows: CR * J1108 8) The monitor will be cleared and the following indication will appear: 2) Partial memory should be modified by the use of monitor command M (memory S-BASICEX SAVER XX XX XX 38 HIT ANY KEY? 9) Push any key. ± Record Play STOP button should be pushed beforehand. 10) Push RECORD button. The copy will start and the following indication will appear: WRITING S-BASIC On the occasion of MZ-711, item 9) should be effectuated after setting the external tape recorder in recording state. 11) After the sound "Pit Pit", the copy will be terminated. 12) The monitor state will be recovered by pushing the rear RESET SW. 13) Rewind the tape and push STOP button. 14) Key in as follows: * JCF0E CR **±** PLAY 15) Push PLAY button of the recorder and the "VERIFY" function will be executed. When successful verified, the indication of "OK!" will appear though no other indication like FILE NAME etc. will appear. When error occured, please restart from the item 4). 16) Please make sure to enable the write protection of the cassette by removing the nail.

B. The following procedure is requested to modify the content of BASIC interpreter.

- a) Operate just as the case for copying mentioned in item 1) to 5).
- b) Call up the address to be modified by using the monitor command M.
 Ex. 8A in 1234H should be changed to 7A.

		Key in
* M		1234
1234	8A	7A CR
1235	8A	SHIFT + BREAK
*		

C. The operation from the item 6) onwards should be continued hereafter.
